The retail prices index (RPI) is the primary measure of price inflation as it affects consumers in the United Kingdom. Monthly figures have been compiled on a similar basis since 1947 and an earlier series - the cost of living index - goes back as far as 1914. Besides the overall ("all items") index there are component indices covering particular categories of goods and/or services. Currently about a hundred such indices are compiled but the amount of detail available for years before 1974 is rather less and for years before 1956 much less.

This volume contains the longest possible time series for each of the indices currently compiled. As the grouping and nomenclature of component indices have changed over the years (most notably in January 1987) uniformity of presentation here has meant showing some of the indices in a somewhat different form from that in which they were originally released. Most of the figures have either been published or are readily derivable from published material but in a few cases data which have previously been disclosed only on special request have now been used to provide "back runs" of currently-published indices. It is hoped that the results will be of use both for analytical purposes and for reference.

In addition to the time series themselves the volume contains various tables of supplementary information, relating to the coverage and construction of the indices, which have often been requested by users and are here brought together in a convenient format.

Further information about the retail prices index can be obtained from the

THE RETAIL PRICES INDEX : A brief guide by A J Machin

The retail prices index -the RPI- is an important barometer of the economy of the UK and shows the impact of inflation on family budgets. The inflation figures are eagerly watched by the media, wage-bargainers, business people and politicians. The index affects us all. It can affect your tax allowances, your savings, state benefits and pensions since these and many other payments are often up-dated using the index.

Not all prices move in the same way. The prices of tomatoes or hi-fi equipment might fall while the prices of apples or petrol rise. The index represents the **average change** in prices of millions of consumer purchases which take place in the market. This is achieved by using a large sample of shops and other places up and down the country and carefully recording the prices of a typical selection of products from month to month.

Shopping basket

A convenient way of thinking about the RPI is to imagine a very large "shopping basket" full of goods and services on which people typically spend their money : from bread to ready-made meals, from electricity bills to clothes, from the cost of a cinema seat to the price of a pint at the local pub. The contents of the basket are fixed but as the prices of individual products vary so does the total cost of the basket. The RPI, as a measure of that total cost, only measures **price changes**. If people spend more because they buy more goods this does not affect the index.

We all spend different amounts on various goods and services which show different price movements. No-one is "average". But many prices are ultimately subject to similar market pressures and we all buy a good variety of things, some of which change in price more than others. For all of us, therefore, there is an element of "swings and round-about" in the way we are affected by inflation. It is convenient to have one simple measure which, though it may not strictly apply to any one individual or family, nevertheless provides most of us with a useful yardstick of the impact of inflation on our own pocket or purse.

Considerable care is taken to ensure that the shopping basket is kept up-to date and is representative of people's shopping patterns; the places and shops we go to, the goods and services which we buy and the amounts we spend on them.

The cost of living ?

The RPI is not strictly a "cost of living" index, a concept which means different things to different people. To many it may suggest the changing costs of basic essentials, but in practice it would be very difficult to agree on a definition of "essentials". The index simply gives an indication of what we would need to spend in order to purchase the same things we chose to buy in an earlier period, irrespective of whether particular products are "needed" or "good for you". For example, some people buy cigarettes, so these are included in the index. However the calculations reflect the average shopping basket and so take account of the fact that a majority of people do not buy tobacco at all.

What is included in the basket ?

The RPI includes virtually all types of household spending as shown in the chart. There are some exceptions such as savings and investments, charges for credit, betting and cash gifts which are out of the scope of the index.

Indirect taxes such as VAT, which are part of the price of the goods and services, are included but income tax and national insurance payments are excluded. (The latter are taken into account in a separate index -the tax and price index - which shows how much tax-payers' gross incomes need to change in order to maintain their spending power after taking account of the tax that has been deducted as well as changes in prices.)

The various principles and concepts underlying the construction of the RPI have been determined by recommendations of the Retail Prices Index Advisory Committee which reports to the Chancellor of the Exchequer and includes members from outside Government.

Structure of the Retail Prices Index in 1991

Price indicators

It would be unnecessary and impracticable to monitor the prices of everything on sale in every single shop. The prices of similar items can reasonably be assumed to move in line with one another in response to market forces. It is therefore sufficient to compile the index using prices of a large and varied sample of products at selected places. There are some 600 separate indicators used in compiling the RPI. The movements of these are taken to represent the price changes for all goods and services covered by the index, including those for which prices are not specifically monitored. For example there are six price indicators for bread which are combined together to estimate the overall change in all bread prices.

Price collection

About the middle of every month price collectors (mainly staff from the Employment Service who act on behalf of the Central Statistical Office), obtain well over 100,000 prices altogether for some 500 of the 600 specified types of goods and services. They go to a variety of shops in 180 areas throughout the country. They visit most of the shops in person to see goods at first hand but some of the work is done by telephone. The price collectors go to the same places and note the prices of the

same things each month so that over time they compare like with like. The reliability of the index is very much dependent on the goodwill of retailers in allowing this information to be collected.

For many goods and services it is more efficient to collect prices centrally. Information on charges such as those for gas, water, newspapers, council rents and rail fares - about 100 indicators in all - are all obtained from central sources. Also some large chain-stores, which charge the same prices at their various branches, help by sending information direct from their headquarters to the Central Statistical Office.

Weighting

We spend more on some things than others and we would expect, for example, that an increase in mortgage interest payments would have a considerably greater impact on the RPI than an increase of similar proportion in the price of tea. The components of the index are therefore carefully "weighted" to ensure that the index reflects the importance of the various contents of the average shopping basket and the amounts we spend in different regions of the country and in different types of shops.

The weights for the index are obtained from a number of sources but mainly from the Family Expenditure Survey. A sample of about 7,000 households throughout the country each year keep records of what they spend over a fortnight and also give details of their major purchases over a longer period.

In calculating the weights, the expenditure of two groups of people is excluded on the grounds that their pattern of spending is significantly different from the great majority. These are people in households with the top 4 % of the incomes, and low income pensioners who are mainly dependent on state benefits. (Separate 'pensioner' indices are published for these.) These restrictions are designed to make the RPI more representative of the "typical household".

Keeping the index up-to-date

It is clearly important that the index is representative and kept up-to-date. The basket of goods and services is fixed for a year at a time, but is reviewed every year and updated as necessary to reflect changing markets, fashions and new products. For example black and white televisions were dropped from the index when sales declined; micro-wave ovens, video-recorders and compact discs were introduced. The weights for the index are also changed each year to keep abreast of the general changes in people's spending patterns. Over the years people have tended to spend a reducing proportion of their money on basics such as food, while electrical goods, travel and leisure etc have accounted for an increasing share of their budgets.

Central Statistical Office, 1991

APPENDIX

Calculating the index

Once all the price data have been fed onto a computer, checked and processed, all the resulting price indicators are combined together. Changes in prices are measured by comparing them to their levels in the previous January and then weighted together using the latest weights for the current year to produce an overall average price change. The final stage in the calculation is to link this average price change with the figures for earlier years. It is only by "chain-linking" the calculations in this way that the index can both take account of changes in the make-up of the shopping basket from year to year and provide comparisons between different years. The procedure ensures that if something is dropped from the basket or introduced, this does not distort the index.

Reference dates

The RPI measures price changes, not price levels; so it is expressed in terms of the comparison of prices relative to January 1987, when the index is given a value of 100. For example the index for January 1991 was 130.2, indicating that £130.20 would buy the same amount in January 1991 as £100 would have bought in January 1987, a rise in prices of 30.2 per cent. The headline figure - the annual rate of inflation - is simply the percentage change in the index obtained by comparing the latest index with the value recorded twelve months ago.

The reference date of January 1987 is arbitrary and merely provides a convenient landmark for comparison. The choice of date has no material effect on the measurement of price changes between one month and another. The reference date has been changed several times, for example in 1962 and 1974. Long term comparisons are obtained by linking the various official indices, if necessary back as far as 1914. The longer term comparisons should of course be treated with some caution as the things people buy have changed so much since the days of mangles and candles.

Index dates

The index always refers to a Tuesday near the middle of each month. Since it can often take longer than one day to collect all the local shop prices, for the sake of efficiency some prices are collected on the Monday or the Wednesday. However, some prices such as those for petrol, which can fluctuate markedly from day to day, and all the centrally collected prices, relate to the Tuesday.

Publication

The figures are first published in a press release as soon as they are ready, usually on a Friday a month after the Tuesday index date. The publication dates for each year are announced in advance. Further details and analysis of the results subsequently appear in the "Employment Gazette" and in several CSO publications, for example the "Monthly Digest of Statistics" and "Economic Trends".

80 COVERAGE OF EXPENDITURE IN THE RPI

RPI section	Categories of expenditure represented
Bread	Loaves & rolls
Cereals	Flour, proprietary breakfast foods, rice & other dry cereals
Biscuits & cakes	Chocolate-coated & other biscuits & wafers; cakes, buns, fruit pies, scones etc
Beef	Beef & veal, including minced beef & burgers but excluding sausages
Lamb	Mutton & lamb
Pork	Pork, excluding sausages
Bacon	Bacon, gammon & uncooked ham
Poultry	Cooked & uncooked, fresh & frozen poultry & game
Other meat	Liver & other offal, uncooked sausages & sausage meat, cooked & canned meat & meat products
Fish	Fresh, smoked, canned & frozen fish; shellfish
Butter	Butter
Oils & fats	Margarine, lard, lower-fat spreads, cooking fats & oils
Cheese	Cheese, including processed varieties
Eggs	Eggs, including dried eggs
Milk	Fresh, sterilised & UHT milk, including skimmed milk
Milk products	Cream; dried & canned milk; yoghurt
Tea	Packeted tea & tea bags
Coffee & other hot drinks	Coffee, cocoa & proprietary food drinks
Soft drinks	Fruit juices & squashes; carbonated drinks; cordials
Sugar & preserves	Sugar, syrup, honey, marmalade & jam
Sweets & chocolates	Sweets, chocolates & other confectionery
Potatoes	Unprocessed & canned potatoes, instant potato powder, frozen chips, crisps etc
Vegetables	Fresh, canned, dried & frozen vegetables (including tomatoes)
Fruit	Fresh, canned, dried & frozen fruit, excluding fruit juices but including nuts
Other foods	Ice cream, canned & packeted food (e.g. "ready meals", soups, jelly); sauces, flavourings & additives
Restaurant meals	All meals eaten on the caterer's premises, apart from canteens
Canteen meals	State school & workplace meals
Take-away meals & snacks	All meals eaten off the caterer's premises
Beer	Beer, stout, ale, shandy, cider etc
Wines & spirits	Spirits & liqueurs; fortified & non-fortified wines
Cigarettes	Cigarettes
Other tobacco	Pipe tobacco, cigars & snuff
Rent	Rent, excluding rates & other charges paid together with rent
Mortgage interest payments	Interest payments on a representative mortgage
House insurance & ground rent	Insurance premia on structure of houses & flats; ground rent & other housing charges
Rates	Local authority rates
Water & other charges	Charges for water supply, sewerage & related services
Repair & maintenance charges	Payments to contractors, including those for house painting & decorating
Do-it-yourself materials	Purchase of materials and tools (other than electrical tools); tool hire
Coal & solid fuels	Coal, coke & proprietary smokeless fuels

80 COVERAGE OF EXPENDITURE IN THE RPI (cont.)

RPI section	Categories of expenditure represented
Electricity	Account & slot meter payments for electricity
Gas	Account & slot meter payments for gas
Oil & other fuel	Fuel oil for central heating, bottled gas, paraffin, firewood, candles etc
Furniture	New & second-hand furniture, including built-in units
Furnishings	Floor coverings, household textiles, mattresses, pillows, cushions etc
Electrical appliances	New & second-hand appliances, repairs & spare parts, including electrical tools but excluding audio-visual equipment & structural space heating appliances
Other household equipment	Gas cookers, china, glass, cutlery, hardware, ironmongery etc, including garden tools
Household consumables	Electrical consumables, soap & detergents, other cleaning materials, matches, toilet paper & other paper products
Pet care	Food & other expenditure on animals & pets, including veterinary services
Postal charges	Postage & poundage
Telephone charges	Telephone account & call box charges; telemessages

COMBINATION OF COMPONENT PRICE INDICES

The detailed indices given on pages 36 to 80 can be combined to suit users' particular requirements where the standard aggregates are not appropriate, by making use of the "weights" which are given in the tables. Up to January 1962 aggregate indices should be calculated as conventional weighted averages of the component indices. Since then, however, the weights have related only to the current year: not to the whole period since the "reference date" (i.e. the date taken as 100). The aggregate indices therefore need to be calculated in several stages, as follows:

- For each component, calculate an index for the current month based on the previous January. This is done by dividing the current month's index by the January index and multiplying by 100.
- Calculate a weighted average of these January-based indices, using the current year's weights. (Each year's weights come into use in February and remain current up to and including the following January.)
- Convert this January-based aggregate index back to the standard reference base. This is done by multiplying it by the aggregate index for the January in question and dividing by 100.

If a January index for the aggregate (on the standard reference base) is not available for the current year (say year T) then it can be calculated sequentially from the component indices, as follows:

- Use the above method with January of year T as the "current" month, to calculate the aggregate index for January of year T with January of year T-1 as 100.
- Then calculate an index for January of year T-1 with January of year T-2 as 100.
- Similarly for as many years (say N) as are necessary to get back to the reference base (January 1987 at present).
- Multiply the N January-on-January indices together and divide by 100 to the power N-1.

For example, suppose the objective is to calculate an aggregate index for Catering in respect of December 1989, with January 1987 taken as 100, from its three components - Restaurants, Canteens meals and Take-away meals/snacks. The data required are as follows:

	Indices (reference base = 100)			Weights		
	Restaurants	Canteens	Takeaways	Restaurants	Canteens	Takeaways
Dec 1990	131.8	131.6	130.7	24	7	16
Jan 1990	122.2	120.6	120.0	26	7	16
Jan 1989	113.9	112.2	112.3	25	8	17
Jan 1988	106.5	106.5	106.3	23	7	16
Jan 1987	100.0	100.0	100.0			

The aggregate index for December 1990 (January 1990 = 100) is:

$$\frac{24 \times 131.8}{122.2} + \frac{7 \times 131.6}{120.6} + \frac{16 \times 130.7}{120.0} \times 100 = 108.41$$

The aggregate index for January 1990 (January 1989 = 100) is:

$$\frac{26 \times 122.2 / 113.9 + 7 \times 120.6 / 112.2 + 16 \times 120.0 / 112.3 \times 100}{26 + 7 + 16} = 107.18$$

The aggregate index for January 1989 (January 1988 = 100) is:

$$\frac{25 \times 113.9 / 106.5 + 8 \times 112.2 / 106.5 + 17 \times 112.3 / 106.3 \times 100}{25 + 8 + 17} = 106.25$$

The aggregate index for January 1988 (January 1987 = 100) is:

$$\frac{23 \times 106.5 / 100.0 + 7 \times 106.5 / 100 + 16 \times 106.3 / 100.0 \times 100}{23 + 7 + 16} = 106.43$$

The linked aggregate index for December 1990 (January 1987 = 100) is therefore:

$$\frac{108.41 \times 107.18 \times 106.25 \times 106.43}{100 \times 100 \times 100} = 131.4$$

This simple example can be generalised to deal with any number of components and any number of linking years. For example, the index for Food is made up from twenty four separate components and calculating special aggregate indices for 1986 on the then-current reference base of January 1974 involves a sequential calculation spanning thirteen consecutive years.

LINKING OF PRICE INDICES

The RPI expresses the level of prices at any given date as a percentage of the corresponding level at a previous date, called the "reference base". For example the "all items" index of 119.5 for January 1990 (January 1987 = 100) means that prices in general increased by 19½ per cent in the three years to January 1990.

The reference base is left unchanged for long periods, recently for about a dozen years at a time, so that direct comparisons can be made between widely-separated dates. However it is sometimes necessary to compare dates which are not covered by the same index series, and this can be done in either of two ways, as follows:

a) Re-scaling to a common reference base

When the reference base is changed there is always an "overlap month" for which there is an index figure on both the old series and the new (the latter being 100). Using this link either index series can be converted to give it the same reference base as the other. In particular, dividing each figure in the old series by the last figure in that series (i.e. the figure for the link month) and multiplying by 100 will convert it to the same reference base as the new series.

For example, calculating the "all items" percentage increase in prices over the ten years to January 1990 involves two index series:

	Old series (Jan 1974 = 100)	New series (Jan 1987 = 100)
January 1980	245.3	A
January 1987	394.5	100.0
January 1990	..	119.5

The missing figure A can be calculated as:

$$A = 245.3 / 394.5 \times 100 = 62.2$$

allowing the percentage change between January 1980 and January 1990 to be calculated directly as:

$$\% \text{ change} = \{ 119.5 / 62.2 \times 100 \} - 100 = 92.1$$

b) Calculating percentage changes without intermediate rounding

Though the above method may be adequate for most purposes it has the disadvantage that some precision is lost through the rounding of the re-scaled index (A in the above example). When the greatest possible degree of precision is required it is therefore more satisfactory to calculate the percentage without intermediate rounding, from the formula:

$$\% \text{ change} = \frac{\text{New series index for later date} \times \text{Old series index for link month}}{\text{Old series index for earlier date}} - 100$$

which, with the figures from the above example, gives:

$$\% \text{ change} = \{ 119.5 \times 394.5 / 245.3 \} - 100 = 92.2$$

This is slightly different from, and more accurate than, the result of method (a).

CENTRAL STATISTICAL OFFICE PUBLICATIONS

ANNUAL

Annual Abstract of Statistics — has some 350 tables generally giving data for the last eleven years covering just about every aspect of economic, social and industrial life.

Social Trends — provides a valuable insight into the changing patterns of life in Britain. The chapters provide analyses and breakdowns of statistical information on population, households and families, education and employment, income and wealth, resources and expenditure, health and social services, and many other aspects of British life and work.

Regional Trends — with over 130 tables and 50 maps and charts, brings together a wide range of government statistics on the various countries and regions of the United Kingdom.

United Kingdom National Accounts — The CSO Blue Book is the essential data source for everyone concerned with macro-economic policies and studies and shows how the nation makes and spends its money. It is issued in early September and covers all aspects of the United Kingdom economy giving data for the last eleven years or longer.

United Kingdom Balance of Payments — The CSO Pink Book is the basic reference book for balance of payments statistics, presenting all the statistical information, for the last eleven years or more, needed by analysts who seek to assess UK transactions with the rest of the world.

Key Data — A "student" version of *Social Trends* with over 130 tables, maps and coloured charts covering a very wide range of social and economic data.

MONTHLY

Economic Trends — a compilation of all the main economic indicators liberally illustrated with charts and diagrams. The largest section gives time series and graphs over the last five years or so. It is the primary publication for quarterly articles on national accounts and the balance of payments as well as others commenting on and analysing economic statistics. The *Economic Trends Annual Supplement* contains long runs of annual and quarterly figures for the key series of economic indicators.

Financial Statistics — gives data on the key financial and monetary statistics of the United Kingdom. Tables usually contain at least 18 monthly and 12 quarterly or 5 annual figures. The biennial *Financial Statistics Explanatory Handbook* contains comprehensive notes and definitions for the tables.

Monthly Digest of Statistics — provides basic information on 20 subjects. Tables contain mostly runs of monthly and quarterly estimates for at least two years and annual figures for several more. The annual *Monthly Digest of Statistics Supplement of Definitions and Explanatory Notes* gives definitions for items and units in the *Digest*. It also applies to corresponding items in the *Annual Abstract* and *Regional Trends*.

OTHERS

United Kingdom National Accounts: Sources and Methods (third edition) — an essential reference book for everyone who makes use of national accounts data. It contains details of the concepts, definitions, statistical sources, methods of compilation and reliability of the various statistical sources which comprise the national accounts.

Statistical News — a quarterly journal providing a comprehensive account of current developments in British official statistics.

Standard Industrial Classification Revised 1980 — is a system of classification of establishments according to industry covering all economic activity.

Indexes to the Standard Industrial Classification Revised 1980 — contains lists of characteristic activities for each heading of the classification as well as an alphabetical index of activities. The publication is also indexed to the previous 1968 classification and to the European standard industrial classification (NACE).

CSO publications are published by HMSO and available from the addresses given on the back cover.
