**The Registrar General's
Statistical Review of
England and Wales**

Part III: Commentary

This annual volume contains detailed analyses of the statistics of life and death already presented in Parts I and II of the Review which are designed to assist, in their administration or research, demographers, statisticians, medical research organisations, public health authorities, and all other individuals and organisations who have to take account of the vital statistics of England and Wales.

The Commentary for 1965 contains a discussion of the effect of the changes in local government arrangements for the Greater London Area and compares statistics for the component administrative areas before and after the changes, a study of illegitimate births by generation and a discussion on methods of calculating area comparability factors.

CANCER REGISTRATION IN ENGLAND AND WALES, 1962-1964

Introduction

Cancer registration in England and Wales began with the records collected by the Radium Commission before the second World War. These statistics referred only to patients treated with radiotherapy. Following the introduction of the National Health Service registration has been gradually extended to cover all hospital patients suffering from cancer.

Since 1962 all fifteen hospital regions in England and Wales have been included in the scheme and figures are given on this basis although, for administrative convenience, some regions have combined for the purpose of cancer registration. The two South Metropolitan regions and the Wessex region all share the same Registry, and the Liverpool Registry covers part of North Wales. The method of collecting data from hospital case notes, and the extent to which it is analysed locally, varies among the different Registries, but in every case a uniform abstract card is completed and sent to the General Register Office for analysis.

National tabulations for cases registered in 1961 were included in the *Registrar General's Statistical Review of England and Wales for the year 1961, Supplement on Cancer*, published in 1967. The present tables are based on registrations in the years 1962 to 1964.

Definitions

Cancer:

For the purposes of the registration scheme the term cancer includes all malignant neoplasms and the reticuloses, i.e. conditions listed under numbers 140-205 of the *International Statistical Classification of Diseases, Injuries and Causes of Death, 7th Revision, 1955*. Benign neoplasms and neoplasms of unspecified nature of the brain, including the pineal and pituitary bodies, are also registered since it is often difficult to decide whether such cases are benign or malignant. Pre-malignant cases of carcinoma of the uterus, "carcinoma-in-situ", are also registered.

Hospital Regions:

The fifteen hospital regions used here consist of aggregations of entire local authority areas, and are identical with the areas of regional hospital boards except where the boundaries of the latter divide local authority areas. Any such divided local authority area is allocated to the hospital region containing the greater proportion of the population. The composition of the hospital regions is published regularly in the *Registrar General's annual Statistical Review of England and Wales* (see for example that for the year 1964, Part I, pages xiii to xvi).

Urban and Rural Areas:

Urban areas include all county and municipal boroughs and urban districts as defined by the Local Government Acts. Rural areas are the rural districts as similarly defined. Disley Rural District and Elstree Rural District have been included in rural aggregates, though by definition they are contained in the South East Lancashire and Greater London conurbations respectively.

Populations:

For the calculation of incidence rates the estimated mid-year home populations have been used. These are as given in Table 2 of the appropriate annual Statistical Review, with slight adjustment for the exclusion of the two rural districts from the conurbations. (If using the 1964 table of populations of hospital regions for the calculation of standardised rates it should be noted that the sum of the estimates for males aged 55-59 exceeds the England and Wales total by 3 thousand; this makes no material difference to the results but can cause confusion in checking).

Area comparisons:

The systematic biases which may make comparisons of the incidence rates from cancer registration in different areas misleading have been outlined in a recent report of the International Union against Cancer.* The chief sources of error arise from local differences in:-

(1) *The proportion of cases which are diagnosed at all*

This depends on the type of tumour, the age of the patient, the health services available and the extent to which patients partake of these services. For comparisons between the hospital regions of England and Wales these differences are probably not very important.

(2) *The proportion of cases which are referred to hospital*

In England and Wales it is probable that all malignant disease which is diagnosed by the general practitioner is referred to hospital at some stage. Exceptions might be the very old patients with advanced disease and those patients who are treated outside the National Health Service. An estimate of the size of this error can be obtained from the percentage of registrations of rapidly fatal tumours which are made in retrospect from information on death certificates. Such a check is carried out routinely by all regions with the co-operation of the General Register Office. Figures from the Liverpool region suggest that the proportion of cases registered in this way is of the order of five per cent or less, slightly higher in women than in men, probably because of the greater number of female patients of advanced age. Again it is likely that this error is fairly uniform throughout the country when age differences are taken into account.

(3) *The proportion of cases referred to hospital which are registered*

There is no doubt that the proportion of cases which, although diagnosed as cancer in hospital, are subsequently registered, varies from region to region and this is probably the greatest source of error in making area comparisons. Some idea of the variability in reporting can be gained from comparing the number of cases of a rapidly fatal tumour registered in a particular region over a given period with the number of deaths in the same interval attributed to the disease. Carcinoma of the oesophagus (ICD 150) is suitable for this purpose, since the incidence of this tumour is reasonably stable. The registrations for cancer of the oesophagus in both sexes in 1962-64, expressed as a percentage of the deaths attributed to the disease in those years in the fifteen hospital regions are as follows:-

Registration of carcinoma of the oesophagus (ICD No. 150) - 1962-64

| Region | Registrations as percentage of deaths |
|-------------------|---------------------------------------|
| Newcastle | 91 |
| Leeds | 99 |
| Sheffield | 92 |
| East Anglia | 103 |
| N.W. Metropolitan | 76 |
| N.E. Metropolitan | 91 |
| S.E. Metropolitan | 95 |
| S.W. Metropolitan | 86 |
| Wessex | 91 |
| Oxford | 104 |
| South Western | 95 |
| Wales | 85 |
| Birmingham | 97 |
| Manchester | 84 |
| Liverpool | 90 |
| All Regions | 91 |

On this basis it appears that reporting is above average in the East Anglian and Oxford regions, and below average in the North West Metropolitan region. These differences must be borne in mind when comparisons of incidence rates are made.

(4) *Age distribution*

Inference from comparison of age-specific rates in different regions is complicated by the small numbers involved, even when several years experience is combined. Crude rates for all ages are biased by differences in age structure of the regions, so that some form of standardisation must be used. The most convenient method is the indirect one, in which the observed deaths in a particular region are compared with an expected figure calculated by multiplying the mid-period estimates of population in the region by the age-specific rates for England and Wales as a whole. When this is done with mortality rates, the ratio of observed to expected deaths, expressed as a percentage, is called the standardised mortality ratio (SMR); similarly, the ratio of observed to expected registrations, multiplied by 100, could be called the standardised registration ratio (SRR).

The SRR will be affected by differences in reporting in the regions, and inferences about variation in incidence are distorted. If one assumes that the completeness of registration is the same for all types of cancer, a second index, which is not subject to this distortion, can be calculated, and might be called the proportional registration ratio (PRR). For a given type of cancer an expected number of registrations is calculated by multiplying the total registrations at a particular age in the region by the fraction of all registrations in England and Wales at that age which were of the given type, and summing over the age groups. The ratio of observed to expected is used as before. The SMR, SRR and PRR for carcinoma of the stomach in males for the years 1962-64 are shown below. The populations used for the SMR and SRR are those estimated for mid-1963.

* *Cancer Incidence in Five Continents. A Technical Report.* Ed. Doll R., Payne P. M., Waterhouse J. A. H. (Distributed for International Union against Cancer by Springer-Verlag, Berlin, New York, 1967).

Carcinoma of stomach (ICD No. 151) - Males - Standardised mortality ratios, registration ratios and proportional registration ratios, England and Wales = 100

Hospital regions, 1962-64

| Region | SMR | SRR | PRR |
|-------------------|-----|-----|-----|
| Newcastle | 123 | 138 | 126 |
| Leeds | 100 | 101 | 101 |
| Sheffield | 100 | 99 | 105 |
| East Anglia | 94 | 95 | 87 |
| N.W. Metropolitan | 78 | 64 | 79 |
| N.E. Metropolitan | 96 | 95 | 94 |
| S.E. Metropolitan | 97 | 97 | 86 |
| S.W. Metropolitan | 81 | 79 | 79 |
| Wessex | 91 | 84 | 86 |
| Oxford | 82 | 89 | 94 |
| South Western | 90 | 96 | 94 |
| Wales | 131 | 126 | 136 |
| Birmingham | 101 | 113 | 104 |
| Manchester | 118 | 102 | 109 |
| Liverpool | 117 | 140 | 112 |

The PRR is on the whole closer to the SMR than is the SRR, and probably gives a more accurate picture of the variation in incidence.

Tables of all the cancer registrations by age, sex and hospital region, 1962-64, required for the calculation of proportional registration ratios, are given in Text Table A following:-

TABLES

Text Table A. Cancer registrations for the years 1962-1964
inclusive by sex, age and hospital region of residence

| Hospital region of residence | | Age-group | | | | | | | | |

SAMPLE CENSUS 1966
ENGLAND AND WALES
COUNTY REPORTS

These reports give statistics derived from the 1966 Sample Census: this was not a complete enumeration of all the people in England and Wales but of a ten per cent sample of the population. The statistics given are for Administrative Counties, County Boroughs, local authority areas with populations of 15,000 or more, and county aggregates. (Figures for smaller areas will be made available at a charge on request to the General Register Office. For details send for Circular C.O. 66/5 to General Register Office, Census Branch, Segensworth Road, Titchfield, Fareham, Hants.)

Local populations are analysed by age, sex, marital condition, birthplace, and socio-economic groups; the analysis of local housing conditions includes the number of dwellings, households by rooms, size of household, tenure, household amenities, car usage and garaging.

(prices vary from 9s. 6d. to 36s. net.)

**The Registrar General's
Annual Estimates of the Population
of England and Wales
and of
Local Authority Areas**

An annual publication issued to meet a general demand for the most recent figures of populations of local administrative area, county boroughs, administrative and geographical counties, the revised standard regions and conurbations. The latest estimates of the population of England and Wales as a whole, by sex, by single years of age to age 20 and by five-year age-groups thereafter, are also given.

Price 2s. 6d. (1967 edition). By post 2s. 9d.

**Population Projections
for the
South East**

by

Eric J. Thompson, BSC (ECON), FSS

This report gives, in some detail, an account of the preparation of the population projections made by the General Register Office in 1966 for South East England and describes the assumptions behind those projections. The period discussed is for the years 1964 to 1981.

The report discusses the projected changes in the population of the region as a whole and of its major sub-divisions and the migration assumptions incorporated in the projections. The assumptions on both migration and natural increase are compared with those made in previous Government estimates.

Price 4s. 6d. (By post 4s. 9d.)
