INTRODUCTION

All patients diagnosed as suffering from cancer and seen at a National Health Service Hospital in England and Wales have been, or should have been, registered with a Cancer Registry. The system has covered the whole of England and Wales since 1962. This volume describes cancer cases first diagnosed (in hospital) in 1968, 1969, and 1970 particulars of which had been registered by 9 January 1973 (1968 registrations), 18 July 1973 (1969 registration), and 1 March 1974 (1970 registrations). The main tables are similar to those of earlier years^{1,2,3}.

In one sense, however, this report is the last of a series. In 1969 the Advisory Committee on Cancer Registration was set up jointly by the Department of Health and Social Security and the Registrar General. The Committee reported in September 1970. In brief it concluded that greater emphasis should be placed on the completeness of basic registration. To enable Cancer Registries to give greater attention to this it recommended that many of the details (for example of staging and treatment) recorded in the scheme at that time should no longer be collected on a national basis. A further reduction in the work of the Cancer Registries would be achieved by arranging for routine mortality follow-up through the National Health Service Central Register. This system of follow-up would also facilitate prospective epidemiological studies by enabling research workers to determine whether persons exposed to known or suspected hazards developed cancer. These recommendations came into effect for registrations in 1971 and will be reflected in later publications. Copies of the full report of the Committee are obtainable from the address below.

From the description of the scope of the Cancer Registration Scheme up to 1970 (Page 8) it will be appreciated that summary tables only have been published in this volume. Users are invited to write for more detailed material of interest to them, as it is only in this way that the data can be used to greatest advantage. Such requests should be addressed to:

EXPLANATORY NOTES

DEFINITIONS USED IN THE NATIONAL CANCER REGISTRATION SCHEME

Cancer

This includes all malignant neoplasms and the reticuloses, i.e. conditions listed under numbers 140 to 209 of the International Statistical Classification of Diseases, Injuries and Causes of Death, 8th Revision 1965. Benign neoplasms and neoplasms of unspecified nature of the brain, including the pineal and pituitary bodies, are also registered, together with carcinoma in-situ of the cervix uteri.

Staging

For Tables 11, 22 and 33 the staging used in this, as in previous reports, is as follows:—

Early primary without secondaries (EP₀); a localised primary growth, i.e. one which has not invaded surrounding tissues, with no clinical involvement of lymphatic glands or distant metastases.

Early primary with secondaries (EP_s); a localised primary growth with clinical involvement of lymphatic glands or distant metastases.

Late primary without secondaries (LP₀); a growth which has invaded surrounding tissues with no clinical involvement of lymphatic glands or distant metastases.

Late primary with secondaries (LP_s); an invasive growth with clinical involvement of lymphatic glands or distant metastases.

Staging of breast cancer

Tables 10, 21 and 32 show the incidence of cancer of the breast staged in accordance with the system recommended by the International Union Against Cancer (UICC). This was only possible in 3,764 cases out of a total of 17,318 cases of female breast cancer registered in 1968, in 4,762 out of 17,623 in 1969 and in 4,519 out of 18,156 cases in 1970. Each case is categorised in three ways, T = primary tumour, N = regional lymph nodes and M = distant metastases. These categories are listed below together with the four stage groupings derived from them.

T N M Categories

T — Primary Tumour

- T1 — Tumour of 2cm. or less in its greatest dimension
 - Skin not involved, except in the case of Paget's disease confined to the nipple
 - No retraction of nipple
 - No pectoral muscle fixation
 - No chest wall fixation
- T2 — Tumour more than 2cm. but not more than 5cm. in its greatest dimension
 - or Incomplete skin fixation (tethered or dimpled)
 - or Nipple retraction (in sub-areolar tumour)
 - or Paget's disease extending beyond the nipple
 - No pectoral muscle fixation
 - No chest wall fixation
- T3 — Tumour more than 5cm. but not more than 10cm. in its greatest dimension
 - or Skin fixation complete (infiltrated or ulcerated)
 - or Peau d'orange present in the tumour area
 - or Pectoral muscle fixation (incomplete or complete)
 - No chest wall fixation

- T4 — Tumour of more than 10cm. in its greatest dimension
 - or Skin involvement or peau d'orange wide of the tumour but not beyond the breast area
 - or Chest wall fixation

Note: The chest wall includes the ribs, intercostal muscles and serratus anterior muscle; it does not include the pectoral muscle

N — Regional Lymph Nodes

- N0 — No palpable homolateral axillary lymph nodes
- N1 — Homolateral axillary lymph nodes palpable but movable
- N2 — Homolateral axillary lymph nodes fixed to one another or to other structures
- N3 — Homolateral supraclavicular or infraclavicular lymph nodes movable or fixed or Oedema of the arm

Note: Oedema of the arm may be caused by lymphatic obstruction; in such circumstances lymph nodes may not be palpable.

M — Distant Metastases

- M0 — No evidence of distant metastases
- M — Distant metastases, including skin involvement wide of the breast, involvement of the contralateral lymph nodes or breast and all cases with clinical or radiographic evidence of metastases to lungs, pleural cavity, skeleton, liver, etc.

Stage groupings

The four stage-groupings are designated by the TNM symbols as follows:

Stage I	— T1 or T2	N0	M0
Stage II	— T1 or T2	N1	M0
Stage III	— T1 or T2	N2 or N3	M0
	— T3 or T4	N0, N1, N2 or N3	M0
Stage IV	— Any combination of T and N symbols including M.		

Hospital regions

Cancer registration is based on hospital region of treatment (or diagnosis) but it is thought to be more useful to present the results by region of residence. As the place of residence of a patient is designated to a local authority area it is necessary for the hospital regions to be reconstructed as aggregations of entire local authority areas. In this volume the fifteen hospital regions of England and Wales are identical with the areas of regional hospital boards except where the boundaries of the latter divide local authority areas. Any such divided local authority area is allocated to the hospital region containing the greater proportion of the population. The detailed composition of the hospital regions is published in the Registrar General's Statistical Review of England and Wales for the year 1970, Part I, pages XXVII to XXX.

Urban and rural areas

Urban areas include all county and municipal boroughs, urban districts and London boroughs as defined by the Local Government Acts. Rural areas are the rural districts as similarly defined.

Populations

For the calculation of incidence rates the estimated home population by sex and age as at the 30th June, for each year has been used — see Registrar General's Statistical Reviews for England and Wales Part II for the relevant years.

Occupation

Occupation for the years 1968 and 1969 has been coded in accordance with the General Register Office Classification of Occupations 1966. The Classification of Occupations 1970 has been used for coding occupation in the year 1970.

REVISION OF INTERNATIONAL CLASSIFICATION OF DISEASES (ICD)

Categories from the Seventh Revision of the ICD that have been taken to correspond with Eighth Revision categories for the purposes of Table C are listed below:

Site of primary	Codes		Site of primary	Codes	
	8th Rev	7th Rev		8th Rev	7th Rev
Lip	140	140	Bone	170	196
Tongue	141	141	Connective and other soft tissues	171	197
Salivary gland	142	142	Breast	174	170
Gum	143	143 144	Cervix uteri	180	171 (Cervix in-situ extracted and shown separately)
Floor of mouth	144				
Other and unspecified parts of mouth	145

Nasopharynx	147	146	Uterus, other	182	
Hypopharynx	148	147	Ovary, fallopian tube, and broad ligament	183	175
Pharynx, unspecified	149	148	Other and unspecified female genital organs	184	176
Oesophagus	150	150	Prostate	185	177
Stomach	151	151	Testis	186	178
Small intestine, including duodenum	152	152	Bladder	188	181.0
Large intestine except rectum	153	153	Other and unspecified urinary organs	189	180 181.7
Rectum and rectosigmoid junction	154	154	Eye	190	192
Liver and intrahepatic bile ducts, specified as primary	155	155	Brain	191	193.0
Gallbladder and bile ducts	156			Other parts of nervous system	192
Pancreas	157	157	Thyroid gland	193	194
Peritoneum and retroperitoneal tissue	158	158	Other endocrine glands	194	195
Nose, nasal cavities, middle ear and accessory sinuses	160	160	Hodgkin's disease	201	201
Larynx	161	161	Multiple myeloma	203	203
Trachea, bronchus and lung	162	162 163 164		204	204
Other and unspecified respiratory organs	163			205	
	164			206 207	

SUMMARY INDICES USED IN THIS REPORT

Standardised registration ratio (SRR)

The incidence of cancer varies greatly with age. The SRR is an index which enables ready comparison of incidence rates in populations with different age structures. It is calculated by denoting one set of age specific rates as the standard. These are then applied to each of several index populations of known age structure to show how many registrations would have been expected in these index populations had they, at each age, experienced the cancer incidence of the standard population. The "expected" incidence so found is then compared with the observed, their ratio being multiplied by 100 to give an index in which 100 is the norm. Table C shows, for each cancer, trends in registration from 1962 to 1970. Experience in 1968 is taken as the standard. The SRR for cancer of the lip in 1963 was calculated as

$$SRR = \frac{100 \times \text{registrations of cancer of the lip in 1963}}{\sum \left(\frac{\text{population at each age, 1963} \times \text{registration}}{\text{age rate for cancer of the lip for that age, 1968}} \right)}$$

for each sex separately.

Table D compares the 1968-70 registration in hospital regions of residence. For each cancer, registration experience in the whole of England and Wales in those years is taken as the standard, and again the sexes are considered separately. The SRR for cancer of the lip in the Newcastle region was calculated as

$$SRR = \frac{100 \times \text{registrations from cancer of the lip in Newcastle}}{\sum \left(\frac{\text{populations at each age, Newcastle} \times \text{registration}}{\text{age rate for cancer of the lip for that age, England and Wales}} \right)}$$

Age-Standardised Proportional Registration Ratio (PRR)

Because of deficiencies in statements of occupation, cancer registrations by occupation cannot be related to populations at risk. In these circumstances the best comparison that can be made is of the proportion of registrations in a particular site. This proportion is compared between occupation orders, with the experience of all occupation orders combined being taken as the standard.

The Supplement on Cancer for 1966 and 1967 introduced such a comparison for males aged 15 to 74, and Table F in that report showed the PRR for each cancer by occupation order without any further adjustment for differing age distributions in the various occupation orders. Thus for cancer of the lip in males in occupation order I the proportional registration ratio was taken as

$$= \frac{\frac{\text{registrations of cancer of lip, occupation order I, males 15-74}}{\text{all registrations of cancer, occupation order I, males 15-74}}}{\frac{\text{registrations of cancer of lip, all stated occupations, males 15-74}}{\text{all registrations of cancer, all stated occupations, males 15-74}}}$$

A similar table appears in this report, but the method of calculation has been extended to include an adjustment for the age distribution of different occupation orders. The revised method of calculation and the inclusion of later registrations for 1966 and 1967 have so altered the previously published table that it has been decided to include it, recalculated, in this report (See Appendix Table III).

Both the tables of cancer incidence by occupation (Text table E and Appendix III) in this report have been obtained by an indirect standardisation of proportional registration rates in 5 year age groups from 15 to 74. For cancer of the lip at ages 15-19 in occupation order I the expected registrations are given by

$$= \frac{\text{all cancer registrations, occupation order I, males 15-19}}{\text{registrations of cancer of lip, all stated occupations, males 15-19}} \times \frac{\text{all registrations of cancer, all stated occupations, males 15-19}}{\text{registrations of cancer of lip, all stated occupations, males 15-19}}$$

The expected registrations of cancer of the lip in males in occupation order I were similarly calculated for each of the other 11 age-groups and totalled. The age-standardised proportional registration ratio (PRR) was then obtained as

$$\text{PRR} = 100 \times \frac{\text{registration of cancer of lip, occupation order I, males 15-74}}{\text{total of expected registrations in each age group, as defined above}}$$

Survival Rates

Both the presentation and the method of calculation of survival rates differ from previous supplements.

Tables 34 and 35 show the 5-year survival of patients registered in 1962, and 1963 respectively. For each site and sex they give the initial registrations with the numbers dead, lost to follow-up, and alive five years after registration. The 5-year crude survival has been calculated assuming that those lost to follow-up had the same experience as those successfully traced, so that if of R registrations there were L_5 lost at 5 years and A_5 alive at 5 years then the 5-year crude survival S_5 would be approximately

$$S_5 = \frac{A_5}{R - \frac{1}{2}L_5}$$

The tabulation of minimum $\left(\frac{A_5}{R}\right)$ and maximum $\left(\frac{A_5 + L_5}{R}\right)$ survival rates has been discontinued.

Cancer patients may of course die from diseases other than cancer, and the likelihood of this happening varies with sex and age at registration. An indirect standardisation has therefore been used to measure corrected survival. The number alive at 5 years has been compared with the number of survivors expected in a group of the same sex and age at registration with mortality as in the population as a whole. Cohort life tables⁴ showing the probability of surviving 5 years from the 5th, 10th, 15th, 20th birthday in 1966 have been used to calculate the number of survivors expected. The calendar period chosen is not truly appropriate to registrations in either of the two years 1962 or 1963 but the correction is thought to be sufficiently accurate in this context. Cancer cases were allocated to the fifth birthday nearest to their age at registration (for example, all aged between $52\frac{1}{2}$ and $57\frac{1}{2}$ at registration were regarded as having been registered on their 55th birthday) and the expected number of 5 year survivors computed, with allowance as before for those lost to follow-up. This was repeated for each sex age-group, the expected values totalled, and the observed survival compared with the total expected survival. In symbols, let

r_i = registrations in sex age-group i

l_{5i} = number of these registrations lost to follow-up before 5 years

p_i = probability of surviving 5 years in sex age-group i at death rates for England and Wales.

Then S'_5 , corrected 5-year survival, is given by

$$S'_5 = \frac{A_5}{\sum_i (r_i - \frac{1}{2}l_{5i}) p_i}$$

The values for corrected survival rates given in earlier reports were age-standardised, but the standardisation was done on very much broader age groups, 0-14, 15-44, 45-64, 65-74 and 75 and over. The table of 5-year survivals from registrations in 1961, published as table 23 in the previous report, has been recalculated with finer age-standardisation, and is available on request.

Tables 36 and 37 in this volume show the results of 5-, 10- and 15-year follow-up on patients registered in 1954 and 1955 respectively. The crude survival to 5 years has been obtained as above, that to 10 and to 15 years by chain multiplication. Of the A_5 patients alive at 5 years let A_{10} be the number alive at 10 years and L_{10} the number lost to follow-up between the 5th and 10th anniversaries.

Then S_{10} , the crude survival to 10 years is given by

$$S_{10} = S_5 \frac{A_{10}}{(A_5 - \frac{1}{2}L_{10})}$$

Similarly, and with similar notation, the 15-year crude survival S_{15} has been given by

$$S_{15} = S_{10} \frac{A_{15}}{(A_{10} - \frac{1}{2}L_{15})}$$

The corrected survival rates S'_{10} and S'_{15} have similarly been obtained by chain multiplication. Survival to the 5th anniversary allows for mortality in the period 1956 to 1960; survival to the 10th anniversary allows for mortality in the period 1961 to 1965 and for the fact that the cohort was 5 years older than at registration; survival to the 15th anniversary allows for mortality at national rates from 1966 to 1970, and for the cohort being 10 years older than at registration. As before, the calendar periods chosen for the standard are not exactly appropriate to registrations in 1954 and 1955, but any inaccuracy caused by this will be small. With notation following that used previously:

$$S'_{10} = S'_5 \frac{A_{10}}{\sum_i (a_{5i} - \frac{1}{2}l_{10i}) P_{2i}}$$

$$S'_{15} = S'_{10} \frac{A_{15}}{\sum_i (a_{10i} - \frac{1}{2}l_{15i}) P_{3i}}$$

Where p_{2i} and p_{3i} are probabilities of survival in 1961 to 1965 and 1966 to 1970 respectively.

CANCER REGISTRATION IN ENGLAND AND WALES 1968-70

SCOPE OF THE CANCER REGISTRATION SCHEME

The initial registration of cancer patients is carried out by regional Cancer Registries which cover England and Wales. In general each of these Registries covers the area controlled by a Regional Hospital Board, although some Regional Hospital Board areas are covered by more than one Registry and one Registry combines the areas of three Regional Hospital Boards. The Registries record cancer cases diagnosed (in hospital) within their respective areas. Although the actual details recorded vary from one region to another the national cancer registration scheme provides for Regional Registries to submit standard abstract cards to the Office of Population Censuses and Surveys (OPCS). These provide data on new cases, and are up-dated and re-submitted after 5, 10 and 15 years so that survival can be assessed.

Information on the cards is coded and transferred to magnetic tape, on which the following are held:

- Registration identifying particulars
- Survival status at 5, 10 and 15 years' duration of survival
- Local authority of usual residence
- Expanded area code (county, area within county, standard region, type of area, urban/rural classification, hospital region, code for new towns)
- Age
- Sex
- Occupation and industry
- Nature of growth (clinical or histological)
- Site of primary tumour
- Stage at presentation
- Anniversary date (date treatment commenced/diagnosed)
- Treatment
- Date of death/loss to follow-up
- Post mortem (performed or not performed) and place of death (hospital or elsewhere)
- Date of first symptom
- Date first sought medical advice
- Date first attended hospital
- Breast case coding (A number of special items including number of pregnancies, for breast cancers only).

INTRODUCTORY TABLES

Annual Registration rates by site, 1968-1970

Table A is a summary of registration rates for cancer in England and Wales by site, sex and age, 1968-1970, diagnoses being classified according to the Eighth Revision of the International Classification of Diseases (ICD). Where the classifications permit, rates in this table may be directly compared with those of Table A in the Supplement on Cancer for 1966-67, in which diagnoses were classified according to the Seventh Revision of the ICD.

Urban/Rural Gradient

Table B gives standardised registration ratios for each primary cancer and density aggregate, 1968-1970. (England and Wales = 100, for technique see the Explanatory Notes.) The ratios are shown for conurbations, urban areas with populations 100,000 and over, urban areas with populations from

50,000 to 99,999, urban areas with populations up to 49,999, and rural areas.

Few cancers are more common in rural than urban areas. Notable exceptions are lip cancer among men and malignant melanoma of skin, although perhaps rather surprisingly other skin cancers do not show this association.

In males, but not in females where the numbers of registrations are so small that it would be hard to detect any trends, the registration ratio for pharyngeal cancers is higher in the more densely populated areas. Lung cancer and the commoner cancers of the gastrointestinal tract (stomach, colon, rectum, pancreas) are more frequent in urban areas.

Cancers of the breast and cervix uteri (and carcinoma-in-situ of the cervix) are least common in rural areas, but show no gradient with further urbanisation. There are no urban/rural gradients for other genital cancers in either sex.

In population centres the lower registration ratio for "malignant neoplasm of illdefined sites" is presumably due to the better facilities for record keeping in these areas. On the other hand, failure to identify a primary site occurs more often in the larger centres; without detailed examination of individual cases any discussion of the reasons for this will be speculative.

Lymphosarcoma and possibly myeloid leukaemias may be more frequent in urban areas, but there is no suggestion of similar trends for other lymphatic and haematopoietic tissue cancers.

Generally, malignant tumours are most common in city dwellers. The stronger urban/rural gradient for males reflects the dominance of the male ratio by lung cancer.

Trends in Cancer Registration

Table C shows age-standardised registration ratios for each site for 1968, 1969 and 1970. (1968 = 100, details of the method are given in the Explanatory Notes.) Where the classifications permit the time series has been extended back to 1962. The categories of the Seventh Revision of the ICD that have been taken to correspond with those of the Eighth Revision are shown in the Explanatory Notes. Not all these comparisons are exact, and users are urged to consult Part III of the Registrar General's Statistical Review for England and Wales, 1967 for a more detailed exposition.

It will be seen that cancers of the lip and tongue are becoming rarer. Time trends in pharyngeal cancers are harder to determine because increased incidence in oropharyngeal cancer (8th Rev. ICD No. 146) may well represent improved diagnoses from the residual category (8th Rev. ICD No. 149) where incidence is decreasing.

The registration ratio suggests that the incidence of gastric cancer is not declining as rapidly as trends in mortality might suggest. Oesophageal, large bowel, and pancreatic cancers are all becoming more common.

Lung cancer is increasing more rapidly among females than among males; this is also apparent in mortality data.

Female breast cancer may be increasing slowly. The lack of systematic trends in age-standardised ratios for cervical cancer conceals different trends in age-specific rates which are visible in birth cohort analyses. Cancers of the testis and of the bladder are each becoming more common.

Registration ratios for Hodgkin's disease and for multiple myeloma both show distinct increases. Because of changes in classification it is possible to examine the leukaemias only as a single combined group and this reveals no clear trend with time.

Cancer Registration by Region

Table D shows age-standardised registration ratios for cancer by site and hospital region of residence, 1968-1970. (England and Wales = 100. For technique see the Explanatory Notes.)

Of the most common cancers, cancer of the stomach is most frequent in the Newcastle region and Wales, and least frequent in the south and east of the country. Lung cancer is most common in the four Metropolitan and Liverpool regions, least common in Wales and the relatively rural regions of East Anglia and the South West. Breast cancer is less common in the Newcastle and Liverpool regions but there are no regions of notably high incidence.

Cancer Registration by Occupation

Table E shows, for males, age-standardised proportional registration ratios for each cancer and occupation order (for method see the Explanatory Notes). Unfortunately, no corresponding table can be produced for females because the description of occupation is copied from hospital records where details are often imprecise even for males. Comparable figures for 1966-67 are given in Appendix Table III and replace those published in Table F of the Supplement on Cancer for 1966-67 which were not standardised for age.

In interpreting Table E it should be noted that the numbers of men in each Occupation Order vary greatly, Order VII (Engineering and Allied Trades Workers) being much the largest, and Orders IV (Glass and Ceramic Makers), XI (Clothing Workers), and XXVI (Armed Forces) being notably small, so that there were fewer than 300 registrations of lung cancer in each of these last three groups. This problem of sample size cannot be ignored, even for the most common cancers, and it is important to be cautious in interpreting this table.

A study of individual occupation units is being undertaken by OPCS and the results from this analysis are available on request.

SERIAL TABLES

Tables 1 to 11, 12 to 22, and 23 to 33 in this report relate to 1968, 1969, and 1970 respectively. They show numbers of registrations and registration rates by site, sex and age for England and Wales and for urban/rural aggregates, and by site and sex for hospital region of residence. There is also a more detailed analysis of site by sex and age, an analysis of selected sites by stage of growth at presentation, and a special table on breast cancers. These tables thus follow in series those published in Supplements on Cancer for 1962-64, 1965, and 1966-67, although, because of the revision of the ICD, direct comparison is not always possible.

The remaining tables in this section of the Report show survivorship at 5 and 15 years as appropriate amongst patients registered in earlier years; the ICD used is that current at the time of initial registration. Details of the methods are given in the Explanatory Notes.

APPENDIX TABLES

In view of the substantial number of 1966 and 1967 registrations received after the Supplement for those years had gone to press it has been decided to include in this volume revised tables of registrations by site, sex and age for these years 1966-67.

For this reason, and because an improved summary index (the age-standardised Proportional Registration Ratio) had been developed in the meantime, Text Table F from the supplement for 1966-67 showing cancer registrations by occupation has also been revised and published as Appendix Table III.

RARE TUMOURS

Over the years a considerable body of literature has been built up on the accuracy and consistency of diagnosis, and many of the studies in this field relate to cancer. But most if not all of these studies have examined the relationship between clinicians' and pathologists' diagnoses; few if any have examined the ability of the statistical systems to preserve specificity of diagnosis.

The process of cancer registration starts in the hospital when a discharge diagnosis is written in the case notes. This diagnosis is copied several times on its way to the cancer registry. Ideally the most specific diagnosis is written down at discharge and copied without error or simplification at later stages, but there has been no check that this is what happens.

An effort has therefore been made to test the operation of these processes by comparing the results with an independent but parallel system. The Royal College of Obstetricians and Gynaecologists keeps a registry of unusual gynaecological tumours both benign and malignant. The material in this registry comes directly from individual consultants, and not through the statistical system. The opportunity has therefore been taken to check the material in this registry against the cancer registry. The results are tabulated below and show a good level of consistency throughout.

Age	The Royal College of Obstetricians and Gynaecologists Registry	Cancer Registry	Follow-up with death certificate diagnosis
67	Uterus - squamous carcinoma	Cervix - carcinoma in situ	Alive
65	Uterus - carcinosarcoma	Uterus - sarcoma	Died 20 months. Uterus - carcinoma
79	Uterus - mixed mesodermal tumour	Uterus - sarcoma	Died 5 months. Uterus - endometrial cancer
54	Uterus - Leiomyosarcoma	Peritoneum - leiomyosarcoma	Died 1 week. Uterus - abdominal sarcoma due to uterine fibroids
41	Uterus - endometrial sarcoma	Uterus - sarcoma	Alive
39	Uterus - sarcoma	Uterus - myosarcoma	Not traced
73	Uterus - sarcoma	Uterus - sarcoma	Died 8 months. Uterus - carcinoma
51	Ovary - thecoma	Ovary - thecoma	Not traced
45	Ovary - thecoma	Ovary - carcinoma	Alive
67	Uterus - sarcoma	Uterus - spindle cell leiomyosarcoma	Uterus - leiomyosarcoma
63	Uterus - sarcoma	Uterus - sarcoma	Alive
51	Uterus - haemangiopericytoma	Uterus - haemangiopericytoma	Alive
46	Uterus - pericytoma	Uterus - pericytoma	Not traced
80	Fallopian tube - carcinoma	Ovary and fallopian tube - carcinoma	Died 3 years. Ovary and fallopian tube - carcinoma
11	Ovary - teratoma	Ovary - carcinoma	Died 5 months. embryonic carcinoma
15	Ovary - teratoma	Ovary - malignant teratoma	Died 3 months. Ovary - malignant teratoma
58	Ovary - mixed mesodermal tumour	Ovary - clear cell adenocarcinoma	Alive
63	Ovary - adenocarcinoma	Ovary - clear cell adenocarcinoma	Died 20 months. Ovary - carcinoma
58	Mixed mesodermal tumour	Ovary - adenocarcinoma	Died 2 months. Carcinoma
23	Ovary - granulosa cell tumour	Ovary - granulosa cell tumour	Died 4 months. Ovary - granulosa cell tumour.
74	Vulva - squamous cell carcinoma	Clitoris - squamous cell carcinoma	Alive
88	Vulva - squamous cell carcinoma	Vulva - squamous cell carcinoma	Alive
60	Vulva - Paget's disease	Vulva - malignant metaplasia. Paget's disease	Alive
85	Vulva - Melanoma	Vulva - malignant melanoma	Died 3 years. Influenza (Cancer not mentioned)
63	Cervix - Leiomyosarcoma	Cervix - fibroleiomyoma sarcoma	Died 6 months. Cervix - fibroleiomyosarcoma

The table only includes those cases that have been registered with the cancer registry. The Royal College of Obstetricians and Gynaecologists registry also contains 2 specimens of cystadenofibroma of the ovary, 8 of Brenner's tumour of the ovary, and one fibromyoma of the vagina, none of which are registrable; 3 specimens of thecoma of the ovary, 4 specimens of granulosa cell tumour of the ovary and 1 specimen of teratoma of the ovary all of which may be benign and, therefore, not necessarily registered.

**MORBIDITY STATISTICS FROM
GENERAL PRACTICE
SECOND NATIONAL STUDY
1970-71**

This report, the second national study of morbidity from general practice, contains information tabulated in a similar manner to that in the report of the first national study conducted in 1955/56. The statistics relating to consultations, persons consulting and episodes of illness with additional information about referrals and place of consultation, are based on the statistical records of 300,000 patients supplied by over 100 general practitioners; the study, method and some aspects of validation are also described.
