REPORT

TO

THE RIGHT HONOURABLE HENRY CHAPLIN, M.P.,

President of the Local Government Board, &c., &c.

(1898.)

SIR,

I HAVE the honour to submit to you the following Report on the estimated population, and on the marriages, births, and deaths registered in England and Wales during the year 1898.

POPULATION.

The population of England and Wales, as enumerated on 6th April, 1891, consisted of 29,002,525 persons. The natural increase by excess of births over deaths from the beginning of April 1891 to the middle of 1898 amounted to 2,637,814 ; and, if there had been neither emigration nor immigration, this would have raised the population to 31,640,339 at the latter date. In the absence of precise information regarding these disturbing causes, the populations in the annual Reports are provisionally estimated on the assumption that the rate of increase which had prevailed in the last completed intercensal period has since been maintained.

The census of London which was taken in March 1896, furnished the means of revising the estimates of the population of the metropolis for the years 1891-96. Accordingly the populations for

these years, which are shown in Table I, and are used in the calculation of the rates of marriage, birth, and death for this Report, are estimated on the assumption that the rates of increase which had occurred (1) in London between 1891 and 1896, and (2) in the remainder of the country between 1881 and 1891, were maintained until the end of 1898. The population of England and Wales calculated in this way amounted, in the middle of the year 1898, to 31,397,078 persons, of whom 15,213,160 were males, and 16,183,918 were females.

MARRIAGES.

During the year 1898, there were registered 255,379 marriages, corresponding to a rate of 16·3 persons married per 1000 of the estimated population. The rates in the five years 1893-97 had been 14·7, 15·1, 15·0, 15·8, and 16·0. Unless, therefore, the recent increase of population has been much more rapid than is allowed for in the provisional estimates, the marriage rate has steadily and substantially risen during the last six years. Among registration counties the lowest marriage rates during 1898 were 12·0 in Rutlandshire, 12·6 in Herefordshire and in Westmorland, 12·8 in Middlesex, and 13·4 in Oxfordshire; the highest rates were 17·5 in Nottinghamshire, in the East Riding of Yorkshire and in Durham, 17·8 in Northumberland, 18·7 in London, and 18·9 in Warwickshire. The five counties which showed the lowest rates in 1898 had also shown the lowest rates in the previous year. Of the six counties which showed the highest rates in 1898, four had in 1897 also been among the counties with the highest rates, whilst the rates in the other two, Durham and Northumberland, had also been above the rate for the whole country.

The further rise of the marriage-rate of England and Wales in 1898 was accompanied by a fall in the value of British exports amounting to 1s. 5d., and a rise in the value of imports amounting to 7s. 7d. per head of the estimated population of the United Kingdom; by a rise of 3s. 10d. per quarter in the price of wheat; and by a rise of £17 per head of the population, in the amount cleared at the Bankers' Clearing House. (Table A.)

Forms of Marriage.—Of the 255,379 marriages in England and Wales during 1898, 174,826, or 685 per 1000, were solemnized according to the rites of the Established Church, and 80,553, or 315 per 1000, were contracted otherwise. As compared with the figures for the previous year, these proportions show a transference of 1 marriage per 1000 from the first to the second of the above categories. Among the Church marriages there was a slight increase in the proportion of marriages by banns, and a decrease in those by licence and by Superintendent Registrar's Certificate. Roman Catholic marriages formed a smaller proportion of the total than in any year since 1892; whilst marriages in registered buildings belonging to other Christian denominations, a also

* The figures in the marriage-rate column are not strictly comparable with those in columns 2, 3, and 4, inasmuch as the former relate only to England and Wales, whilst the latter relate to the whole of the United Kingdom. The figures relating to exports and imports and to the price of wheat, as well as those showing the amount cleared at the London Bankers' Clearing House, are derived from the Board of Trade Statistical Abstracts.

marriages of Quakers and of Jews, showed the same proportions as in 1897. The proportion of civil marriages increased from 146 per 1000 in 1896 and in 1897 to 148 in 1898. (Table 7.)

First Marriages; Re-marriages.—Of the 255,379 men who married during the year under notice, 231,085, or 905 per 1000, were bachelors, and 24,294, or 95 per 1000, were widowers. Of the 255,379 women who married, 238,095, or 932 per 1000, were spinsters, and 17,284, or 68 per 1000, were widows. (Table 9.) The proportions of re-marriages of both sexes are the lowest on record, the figures having shown an almost continuous decline for many years, as the following table shows :—

		In 1000 Marriages.		
		Widowers.	Widows.	
1871-75	...	138·2	100·2	
1876-80	...	136·2	98·0	
1881-85	...	126·0	89·2	
1886-90	...	119·0	83·0	
1891-95	...	112·8	79·2	
1896	...	103	73	
1897	...	98	69	
1898	...	95	68	

Of the persons who married in the course of the year 1898, 376 are described in the marriage register as having been previously divorced.* This is the largest number of such marriages on record, the numbers in the three years 1895-97 having been 262, 296, and 311 respectively. Of the 376 divorced persons who re-married in 1898, 203 were men, of whom 160 married spinsters and 32 married widows; and 173 were women, of whom 133 married bachelors and 29 married widowers; in 11 cases divorced men married divorced women.

Ages at Marriage.—Among the persons who married in 1898, 51 per 1000 of the husbands and 168 per 1000 of the wives were minors. The proportion of husbands who were under age was

* In Table 9, and in the Abstracts on pp. 64-74, divorced persons are included among bachelors and spinsters.

the same as in the previous year, and lower than in any other year since 1851. The proportion of wives who were under age was the lowest in any year since 1851. The following figures show the decline in marriages of minors since 1871 :—

		Minors in 1000 Marriages.	
		Husbands.	Wives.
1871-75	...	81·6	223·2
1876-80	...	77·8	217·0
1881-85	...	73·0	215·0
1886-90	...	63·2	200·2
1891-95	...	56·2	182·6
1896	...	53	174
1897	...	51	170
1898	...	51	168

Among registration counties the lowest proportions of husbands under age at marriage in 1898 were in Dorsetshire, Herefordshire, Shropshire, Rutlandshire, and North Wales. The lowest proportions of wives under age were in Herefordshire, Shropshire, Rutlandshire, Westmorland, and North Wales. In nearly all of these counties marriages of minors had also been comparatively few in 1897 and in previous years.

In other counties the number of husbands under age at marriage ranged upwards to 64 per 1000 in Northamptonshire, 67 in Warwickshire, 70 in Staffordshire, 77 in Leicestershire, 79 in Nottinghamshire, and 86 in Bedfordshire; and the number of wives under age to 199 per 1000 in Staffordshire, 203 in the East Riding of Yorkshire, 207 in Monmouthshire, 213 in Derbyshire, 227 in Nottinghamshire, and 229 in Durham. These counties had also shown the highest proportions of minors of the two sexes respectively in the year 1897, and, with one exception only, in the ten-year period 1888-97 (Table 10).

Among the 510,758 persons who married in 1898, all but 3517, or 1·4 per cent. of the husbands, and all but 3734, or 1·5 per cent. of the wives, made definite statements of age in the marriage register. Compared with the decreasing percentages of unstated ages in recent years, these figures show a further reduction. Of the 56,005 minors who married, all but 15, or 1 in 3734, stated their ages. Among the adults, 98·55 per cent. of the husbands

Marriages.

and 98·25 per cent. of the wives made definite statements of age : the remaining 1·45 per cent. and 1·75 per cent. respectively being indefinitely described as "of full age."

As in the previous year, unstated ages were much more frequent in re-marriages than in first marriages, and they were most frequent in re-marriages of widowers. This is shown by the following figures :—

	Percentage of Ages not stated.	
	Adult Husbands.	Adult Wives.
In Marriages of—		
Bachelors with Spinsters	1·1	1·3
Bachelors with Widows	2·4	2·8
Widowers with Spinsters	4·3	4·5
Widowers with Widows	4·7	4·9
In all Marriages of—		
Bachelors	1·1	1·4
Widowers	4·5	4·6
Spinsters	1·3	1·6
Widows	3·6	3·9

All these percentages are less than the corresponding figures for 1897. Estimates of the mean ages at marriage in 1898, being based on increased percentages of recorded ages, may therefore be regarded as more nearly accurate than similar estimates for 1897 and previous years. Table B. contains comparative figures for 1897 and 1898 on the plan which was described in detail on p. xi. of the Fifty-ninth Annual Report.

The mean of the recorded ages of bachelors who married was '01 of a year less in 1898 than in 1897. The general tendency in recent years has been for this figure to increase; it would be unsafe to infer that the slight decrease during the year under notice indicates a returning tendency towards early marriage. The mean recorded age of spinsters who married was greater in 1897 than it had been in 1896, and it again shows an increase in 1898. The mean age of those who re-married in 1898 shows an increase among widowers and a decrease among widows.

Marriages.

Signature in Marriage Register.—The marriage records for 1898 show a further decrease in the proportions of both sexes who sign the register with marks. The proportion of illiterate men fell to 31, and the proportion of illiterate women fell to 36 in 1000 marriages. In 10 per 1000 of the marriages both bride and bridegroom signed with marks; in 21 the bridegroom signed by mark and the bride wrote her name; and in 26 the bride signed by mark and the bridegroom wrote his name. The following figures show the progressive decline in the proportion of illiterates since 1871:—

Years.	Signed by Mark in 1000 Marriages.		
	Husbands.	Wives.	Both.
1871-75...	185·4	251·8	104·2
1876-80...	148·0	199·8	74·6
1881-85...	123·4	154·8	54·4
1886-90...	84·0	98·2	30·2
1891-95...	51·2	59·6	16·6
1896	37	43	11
1897	33	40	10
1898	31	36	10

The counties which in 1898 showed the highest proportions of illiteracy were: among men, Huntingdonshire, Cambridgeshire, Suffolk, Cornwall, Herefordshire, Shropshire, Staffordshire, and North Wales; and among women, Staffordshire, Lancashire, the West Riding of Yorkshire, Durham, Monmouthshire, South Wales, and North Wales. With very few exceptions these counties had also been similarly distinguished in the year 1897 and in the ten-year period 1888-97.

Attention has been drawn in previous Reports to two peculiarities concerning the local distribution of illiteracy:—First, that illiterates of both sexes are more numerous in the Northern than in the Southern parts of the country; and, secondly, that in the Southern part of the country generally (with the exception of London), illiteracy is more common among the men than among the women who marry, whilst in London and in the Northern part of the country the reverse obtains. Both of these peculiarities are again shown by the figures for 1898. Referring to Table 10 the counties

may be grouped thus:—(1) London as one section; (2) the continuous area formed by the whole of the second, third, fourth, and fifth registration divisions, together with the counties of Gloucestershire, Herefordshire, and Shropshire from the sixth division, and Leicestershire, Rutlandshire, and Lincolnshire from the seventh division as a second section; and (3) the continuous area formed by the remaining counties as a third section. The several proportions of illiterates in 1000 marriages during 1898 were as follows:—

	Husbands.	Wives.
First Section—LONDON	25	32
Second Section—Divisions II., III., IV., V., and counties of Gloucester, Hereford, Salop, Leicester, Rutland, and Lincoln.	30	22
Third Section—Divisions VIII., IX., X., XI., and counties of Stafford, Warwick, Worcester, Nottingham, and Derby.	34	45

In every county of the second section (except Leicestershire, where the numbers were equal) there were more illiterate husbands than wives; and in every county of the third section, except Westmorland, there were more illiterate wives than husbands. Closer examination of the registers shows that there are 5 districts in London and 40 districts in the third section, in each of which the aggregate of husbands and wives who signed by mark exceeded 100 in every 1000 marriages. In these 5 London districts, viz., London City, Bethnal Green, Whitechapel, St. George-in-the-East, and Mile End Old Town, 113 per 1000 of the husbands and 159 per 1000 of the wives signed by mark, the proportions in Mile End Old Town reaching 196 and 259 per 1000 respectively. The marriage registers indicate that these persons are mainly foreign Jews. Excluding the 5 districts named, the proportions of illiterates in the remainder of London are 16 per 1000 husbands and 18 per 1000 wives. In the above-mentioned 40 districts of the third section, 58 out of 1000 bridegrooms and 77 out of 1000 brides signed by mark; whilst in the remainder of the section, after excluding these 40 districts, the proportions were 27 and 36 per 1000 among bridegrooms and brides respectively. Among districts in the northern counties in which specially large proportions of brides and bridegrooms sign with marks are Dudley, Birmingham, Liverpool, Leeds, Dewsbury, and Sheffield. Out of 137 marriages during the year in one parish church in the district of Dewsbury, there were 110 in which both the contracting parties signed by mark; and out of 108 marriages in one parish church in Sheffield, there were 58 in which both parties signed by mark.

Buildings registered for the Solemnization of Marriages.—At the end of the year 1898 there were 15,301 churches or chapels of the Established Church in which marriages can be solemnized, showing an increase of 39 upon the number at the end of 1897. There were also 12,285 buildings on the register for marriages by rites other than those of the Established Church, showing an increase of 287 upon the number on the register at the end of the previous year. (Table 6.)

Certified Places of Worship.—The number of buildings certified for religious worship in the course of 1898, and recorded in the official register under the provisions of the Acts 15 & 16 Vict. c. 36, and 18 & 19 Vict. c. 81, was 581; while 370 buildings were removed from the register on proof of disuse: the total number on the register at the end of the year 1898 was 23,615.

BIRTHS.

The births registered during the year 1898 numbered 923,265, and were equal to a rate of 29·4 per 1000 persons living. This is the lowest rate since civil registration began, and 1·1 per 1000 below the average rate in the preceding ten years. There are only three other instances on record of a birth-rate below 30 per 1000, viz., 29·6 in 1894, and 29·7 in 1896 and again 29·7 in 1897. Among registration counties the lowest birth-rates during 1898 were 21·5 in Rutlandshire, 22·9 in Sussex and in Westmorland, 24·1 in Oxfordshire, and 24·4 in Surrey; the highest were 32·5 in Northumberland, 32·9 in Warwickshire, 33·0 in South Wales, 33·4 in Monmouthshire, 35·2 in Durham, and 35·3 in Staffordshire.

Sex.—The births of males numbered 468,920, and the births of females 454,345. The births of males were therefore to those of females as 1032 to 1000, the average proportion in the preceding ten years having been 1036 to 1000. In registration counties the lowest proportions of male to female births during 1898 were 970 to 1000 in Huntingdonshire, 984 in Berkshire, 1001 in Worcestershire, 1005 in South Wales, and 1013 in Suffolk. The highest proportions were 1067 to 1000 in Cambridgeshire and in Leicestershire, 1072 in Dorsetshire and in Rutlandshire, 1076 in Somersetshire, and 1106 in Herefordshire.

Illegitimate Births.—The infants registered in 1898 as born out of wedlock numbered 38,333; they were in the proportion of 42 per 1000 births, the same proportion having also obtained in each of the three years immediately preceding. In proportion to population, the illegitimate birth-rate was equal to 1·2 per 1000, which had also been the rate in 1897. (Table 3.) Among registration counties the lowest proportions of illegitimate to total births were 29 per 1000 in Essex, 30 in Middlesex, 32 in

Warwickshire, 33 in Somersetshire, and 34 in Monmouthshire and in South Wales. The highest proportions were 60 per 1000 in North Wales, 62 in Westmorland, 63 in Norfolk, 67 in Cumberland, 72 in Shropshire, and 78 in Herefordshire. The six counties last mentioned had also shown the highest average ratios of illegitimate to total births in the ten years 1888-97. (Table 11.)

DEATHS.

The deaths registered in England and Wales during the year 1898 numbered 552,141, and were in the proportion of 17·6 per 1000 of the population, or 0·8 below the mean rate in the ten years immediately preceding. With the exception of the rates in 1894, 1896, and 1897, the rate in 1898 was the lowest on record. (Table 3.)

Among registration counties the lowest rates were 13·4 in Westmorland, 14·0 in Middlesex, 14·1 in Oxfordshire, 14·2 in Surrey, 14·4 in Sussex, 14·5 in Buckinghamshire, 14·7 in Wiltshire, and 14·9 in Berkshire. The highest county rates were 18·3 in London, 18·4 in the West Riding and in the East Riding of Yorkshire, 19·0 in Warwickshire, 19·3 in North Wales, 19·4 in Lancashire and in Durham, and 19·8 in Staffordshire and in Northumberland. (Table 11.)

Sex.—The 552,141 registered deaths in England and Wales included 283,981 of males and 268,160 of females. Among males the death-rate was equal to 18·7, and among females to 16·6, per 1000 living of each sex respectively. Compared with the average death-rate in the seven years which have elapsed since the last census, the rate of mortality in 1898 was lower by 4 per cent. among both males and females. Out of equal numbers living, there were 1127 deaths of males to 1000 deaths of females, as compared with an average proportion of 1124 to 1000 in the ten years 1888-97. (Table 3.)

Ages at Death.—At the age-groups between 5 years and 20, the death-rates of both sexes were the lowest on record. In the groups between 20 years and 35, the death-rates of males slightly exceeded, whilst those of females corresponded to, the lowest rates on record. Among children under 5 years of age, and among persons between 35 and 75 years of age, the death-rates of both sexes although low were somewhat in excess of the lowest corresponding rates previously recorded; and at ages above 75 years the excess was more marked. (Tables 13-14.) The average death-rates at all groups of ages in the three years 1896-98, however, compare very favourably with the corresponding

rates in recent previous years; this is shown by the following figures:—

DEATHS TO 1000 LIVING.													
Periods.	Under 5 years of age.	5—	10—	15—	20—	25—	35—	45—	55—	65—	75—	85 and upwards.	
MALES.	1871-75	69·9	7·1	4·0	5·7	8·1	10·0	14·3	20·3	34·8	70·0	149·5	323·3
	1876-80	67·0	6·3	3·4	4·9	6·7	8·7	13·4	19·8	34·9	69·4	152·2	331·6
	1881-85	61·3	5·8	3·2	4·5	6·0	8·2	12·8	19·3	34·2	68·7	145·4	297·8
	1886-90	61·9	4·9	2·8	4·1	5·5	7·4	12·0	19·4	35·2	72·1	147·9	313·8
	1891-95	62·1	4·5	2·5	4·0	5·3	7·2	12·2	19·8	36·3	71·9	149·9	290·6
	1896-98	60·1	3·8	2·2	3·5	5·0	6·5	11·2	18·1	33·7	63·6	138·4	267·7
FEMALES.	1871-75	60·0	6·6	4·0	5·9	7·4	9·2	12·0	15·9	28·7	61·2	135·3	293·8
	1876-80	56·8	5·9	3·5	5·0	6·2	8·0	11·2	15·4	28·6	60·8	135·5	299·0
	1881-85	51·9	5·7	3·3	4·7	5·9	7·9	11·0	15·2	28·1	59·0	128·9	265·4
	1886-90	52·0	4·9	2·9	4·1	5·2	6·9	10·3	15·0	28·8	61·7	132·3	276·2
	1891-95	52·0	4·5	2·7	4·0	4·9	6·7	10·3	15·3	29·8	62·8	136·1	263·8
	1896-98	50·6	3·9	2·3	3·4	4·3	5·9	9·3	14·0	27·0	55·0	124·6	247·7

It will be seen by this table that at most of the earlier ages the fall in the death-rate has been practically continuous among both males and females from the first quinquennium to the last, and that the slight rise which temporarily occurred from 1886 to 1895 was limited mainly to the higher ages.

If the mortality in the year 1898 of persons above 85 years of age be disregarded, it appears that among persons at each of the remaining eleven age-groups, the rates in the counties of Stafford, Lancaster, and Northumberland were in excess of the averages for the whole country. In London the rates were in excess at all age-groups except those between 10 and 35 years; in Warwickshire at all groups except those between 5 and 25 years and between 75 and 85 years; in Cheshire at all groups except those between 10 and 25 years; in the West Riding of Yorkshire at all groups except those between 25 and 45 years; and in the North Riding of Yorkshire at all age-groups except those below 10 years and between 55 and 75 years; whilst in Durham the only exception to rates above the average was at the age-group 35-45. In South Wales the rates at all age-groups under 35 years were above, whilst the rates at all age-groups above 35 years were below the respective averages. In most of the home counties, and in the southern parts of the country generally, the rates at all age-groups were, with a few unimportant exceptions, below the averages; in the midland counties there were but few instances of excessive rates at any age. (Table 16.)

Infantile Mortality.—In the year 1898 the proportion of deaths of infants under one year of age to registered births was 160 per 1000,

which is 11 per 1000 higher than the average proportion in the preceding ten years. In registration counties infantile mortality ranged from 99 per 1000 in Wiltshire, in Dorsetshire, and in Westmorland, 101 in Oxfordshire, and 113 in Huntingdonshire and in Shropshire, to 172 per 1000 in the East Riding of Yorkshire, 173 in the West Riding, 177 in Staffordshire, in Warwickshire, and in Northumberland, 181 in Lancashire, and 185 in Durham. (Table 11.)

The mortality of male infants was 175·2, while that of female infants was 145·0 per 1000 births of each sex respectively. In equal numbers born the deaths of males to the deaths of females under one year of age were in the proportion of 121 to 100, which tallies very closely with the proportions in previous years.

Urban and Rural Mortality.—At page cxix. will be found two tables showing the variations in the death-rates during a series of years, in the groups of districts which are taken to represent severally the urban and the rural portions of England and Wales. In the year 1898, the urban death-rate was equal to 18·3 per 1000, and the rural rate to 16·0 per 1000 of the respective populations. The urban rate was lower than the average of the ten preceding years by 1·0 per 1000, and the rural rate was lower by 0·8 per 1000. In the year 1898, the ratio of urban to rural mortality was as 114 is to 100, which is slightly below the average ratio in the ten years immediately preceding. (Tables 29, 30.)

REGISTERED CAUSES OF DEATH.

In the year 1881 a new system of classification of causes of death, based on the second edition of the nomenclature of diseases issued by the Royal College of Physicians, was adopted in these Annual Reports. This change involved many important modifications; and in arranging the details of Tables 17 to 22 of the present Report the figures published in the Reports prior to 1881 have been corrected, and made for the most part comparable with the figures for subsequent years. With regard to the years 1879 and 1880, however, there still remain a few instances in which no satisfactory adjustment is practicable. In order to explain, as clearly as possible, the discrepancies between the old tables and the new, the following expedient has been adopted. Every heading in Tables 17-22 affected by a change of classification is marked either with an asterisk or with a dagger, or with both. An asterisk denotes a change or changes in respect of which full correction has been carried out; a dagger denotes a change or changes in respect of which no correction, or only partial correction, has been practicable. All the headings thus affected appear in alphabetical order in a numbered list of diseases printed in the Fifty-seventh Annual Report (pp. lxxiv-ix.). Changes of classification are indicated in that list by means of reference numbers.

The deaths registered in 1898 and in the ten years immediately preceding, when distributed to the several "classes" by their assigned causes, were equivalent to the rates shown in the following table :—

TABLE D.—ANNUAL RATES OF MORTALITY from the SEVERAL CLASSES of DISEASES, per 1,000,000 PERSONS LIVING.

YEAR	All Causes.	Zymotic Diseases.	Parasitic Diseases.	Dietetic Diseases.	Constitutional Diseases.	Developmental Diseases.	Local Diseases.	Violence.	Ill-defined and not specified Causes.
1888	18,111	2,134	25	64	3,167	1,569	9,641	622	889
1889	18,221	2,455	25	67	3,224	1,550	9,392	614	894
1890	19,547	2,539	24	81	3,374	1,611	10,367	653	898
1891	20,216	2,706	23	83	3,339	1,690	10,807	670	898
1892	18,982	2,785	21	79	3,168	1,624	9,801	651	853
1893	19,170	3,165	20	88	3,210	1,593	9,536	675	883
1894	16,594	2,256	15	71	3,017	1,462	8,423	639	711
1895	18,727	2,822	17	79	3,169	1,678	9,433	680	849
1896	17,101	2,549	14	83	3,001	1,536	8,536	643	739
1897	17,436	2,591	12	90	3,067	1,613	8,651	664	748
Mean 1888-97	18,411	2,600	20	79	3,174	1,593	9,459	651	835
1898	17,586	2,761	12	92	3,066	1,620	8,652	646	737
Number of Deaths in 1898.	552,141	86,755	403	2,854	96,265	50,814	271,733	20,278	23,039

Zymotic or Specific Febrile Diseases.—The registered deaths in the year 1898 from diseases of the zymotic class numbered 86,755, and were equal to 15·7 per cent. of the mortality from all causes. These deaths corresponded to a rate of 2761 per million of the population, as compared with an average rate of 2600 per million in the ten years immediately preceding. As had been the case in the year immediately preceding, the excess in zymotic mortality during 1898, compared with the average, was mainly due to the increase in the fatality of both influenza and diarrhoea, especially of the latter disease. (Tables 17-22.)

Small-pox.—The deaths returned as due to small-pox in the year 1898 numbered 253, and were equal to a rate of 8 per million of the population. Of the 253 deaths from small-pox, not fewer than 242 occurred in the north of England. Of these deaths 212 were registered in the district of Middlesbrough (165 in the first quarter and 45 in the second quarter of the year). The borough of Middlesbrough itself was credited with 199 deaths from small-pox,

corresponding to a death-rate of 2119 per million. In the county of Durham 15 deaths from small-pox were registered, and in Northumberland 6 deaths; these occurred partly in areas adjacent to Middlesbrough, and partly in a group of districts near the mouth of the Tyne. Of the 253 persons who died of small-pox in the year under notice, 107 were returned as vaccinated, and 59 as not vaccinated; whilst with respect to the remaining 87, no definite statement concerning vaccination appeared in the certificates. In addition to the deaths definitely referred to small-pox, 116 were attributed to chicken-pox, and 26 to effects of vaccination. It thus appears that in the year 1898, the total number of deaths either certainly or possibly caused by variola, and of deaths alleged to have been caused by measures taken for the prevention of that disease, was 395, or 13 per million of the population.

The 26 deaths ascribed to "Effects of Vaccination" include not only the deaths that were directly referred to vaccination, but also those that were stated by medical attendants, or were found on enquiry, to have been caused by the entrance of any noxious material whatever at the site of vaccination. The mortality from the effects of vaccination, as thus defined, in proportion to children vaccinated cannot yet be given for the year 1898; but it appears from the Twenty-eighth Annual Report of the Local Government Board that the operation of vaccination was performed on 602,922 of the children whose births were registered in the year 1896, which is the latest for which such particulars are as yet accessible. The number of deaths registered in 1896 under the heading "Effects of Vaccination" was 42, or one to every 14,355 vaccinated.

Measles.—In the year 1898 there were 13,220 deaths from measles, which corresponded to a rate of 421 per million living; this is lower by 11 per million than the decennial average rate for 1888-97.

The highest county death-rates from measles in the year under notice were 572 per million in Gloucestershire, 682 in London, 829 in Cumberland, 894 in Staffordshire, and 912 in Leicestershire. The lowest county rates were 37 per million in Dorsetshire, 88 in Oxfordshire, 96 in Cornwall, 126 in Lincolnshire, 137 in Herefordshire, and 150 in Shropshire. The three counties which sustained the heaviest mortality from measles showed also the greatest excess as compared with their average mortality from this disease. In Cumberland the excess was equal to a rate of 360 per million, in Staffordshire of 345 per million, and in Leicestershire of 563 per million, as compared with the several averages.

Scarlet Fever.—The deaths from scarlet fever in the year 1898 were 3548 in number, and corresponded to a rate of 113 per million. This rate is the lowest on record; it is considerably below the rates in the years 1896 and 1897, and is lower by 42 per cent. than the average rate in the ten years 1888-97. The lowest county rates of mortality from this disease were as follows:—Bedfordshire 6 per million, Monmouthshire 10, Oxfordshire 16, Berkshire 18, Devonshire 20, Huntingdonshire 21, Hertfordshire 27, and Westmorland 30. The counties with the highest

rates were Cheshire 150, Lancashire 157, Durham 164, Leicestershire 166, West Riding of Yorkshire 169, Northamptonshire 181, Staffordshire 201, and Derbyshire 216.

During the year under notice 582 deaths of London residents from scarlet fever were registered either in London or in the Metropolitan Asylum Hospitals outside London; and of these, 494, or 85 per cent., occurred in public institutions, as against 69, 68, and 76 per cent. respectively, in the three years immediately preceding.

Enteric (Typhoid) Fever.—Prior to the year 1888 the mortality from enteric fever had only once fallen below 180 per million living. During the ten years 1888-97 the mortality only once exceeded this figure, whilst it was as low as 137 in the year 1892, 159 in 1894, and 156 in 1897, the average for the ten years being 172. In the year 1898, however, there were 5708 deaths from this disease, corresponding to a rate of 182 per million living.

The eight counties which suffered the highest death-rates from enteric fever in 1898 were:—The North Riding of Yorkshire 225 per million, the East Riding 252, the West Riding 253, Lancashire 275, Norfolk 280, Durham 296, Nottinghamshire 305, and Staffordshire 320. All these counties, except the North Riding of Yorkshire and Staffordshire, had appeared in the list of eight counties with highest enteric fever rates in 1897, and all except Norfolk had also appeared in the corresponding list for 1896. The excessive mortality in Norfolk was, as had also been the case in 1897 and in some previous years,* due to local prevalence in the districts of Norwich, Yarmouth, and King's Lynn. In Nottinghamshire, 164 out of 170 deaths from this disease occurred in the contiguous districts of Worksop, Mansfield, Basford, and Nottingham, which form the western portion of the county; these districts had also shown high death-rates from enteric fever in recent previous years. In Staffordshire nearly the whole of the deaths occurred in two groups of districts, namely, Stoke-upon-Trent together with Wolstanton in the north of the county, and Wolverhampton, Walsall, West Bromwich, and Dudley in the south. In the Report for 1897, two separate areas in the West Riding of Yorkshire were named as specially subject to enteric fever mortality; examination of the figures for 1898 shows a considerable increase of fatality in these areas and also in the two districts which form a connecting link between them: it may therefore be said that one continuous area was notably affected in 1898; this area lies in the southwestern part of the county and consists mainly of the cities of Sheffield, Leeds, and Bradford, together with the registration districts of Rotherham, Doncaster, Barnsley, Wakefield, Dewsbury, North Bierley, Halifax, Todmorden, and Keighley. Throughout the year under notice the mortality in the East Riding was, as it had also been in 1897 and in earlier years, practically limited to the registration districts of York, Hull, and Sculcoates, the last two of which are nearly co-terminous with the borough of Hull.

The incidence of fatal enteric fever in the group of 19 districts (comprising nearly the whole of Durham and the neighbouring parts of Northumberland and of the North Riding of Yorkshire), to

* Cf. Sixtieth Annual Report, p. xix.

which special attention has been given in several recent Reports, showed considerable changes in 1897. Further changes may be noticed in the figures for 1898. (Table E.) The mortality in 14 of these districts during the year under notice was below the average for the eight preceding years; and in seven districts, namely, Guisborough, Darlington, Stockton, Hartlepool, Chester-le-Street, Gateshead, and Tynemouth, it was below the rate for the whole country. In seven other districts, however, Middlesbrough, Sedgefield, Auckland, Easington, Sunderland, South Shields, and Newcastle-on-Tyne, the mortality during 1898 was very excessive; in most of these districts the death-rate was higher than that of the previous year, and also higher than the average for 1890-97. Of these seven districts, the following five, Auckland, Sedgefield, Easington, Sunderland, and South Shields, form one continuous area, whilst the other two lie respectively a little to the north and a little to the south of this area.

* The Newcastle Hospital for Infectious Diseases is situated in Tynemouth district; for the purposes of this table, deaths from enteric fever of Newcastle residents in this institution have been transferred to Newcastle-on-Tyne district.

Diphtheria.—In the year 1898 the deaths referred to diphtheria (exclusive of "croup" unless stated to be membranous) were 7661 in number, and corresponded to a rate of 244 per million of the population. This is the lowest rate since 1892, but it slightly exceeds the average rate in the ten years 1888–97.

Of the total deaths attributed to this disease in 1898, not fewer than 6995, *i.e.*, more than nine-tenths were those of children under ten years old. Among males at all ages, diphtheria caused a mortality equal to 245 per million living of that sex, and among females a mortality equal to 243 per million.

Compared with the average in extra-metropolitan England,* there were 17 counties which showed excessive diphtheria mortality in the year under notice. Arranged in decreasing order of fatality, the nine counties with highest rates stand as follows:—South Wales, Kent, Rutlandshire, Essex, London, Monmouthshire, Bedfordshire, Middlesex, and Staffordshire.

The abnormally high death-rate from diphtheria in South Wales as a whole was mainly due to excessive fatality in two groups of registration districts which form respectively the eastern and the south-western portion of Glamorganshire. The eastern group consists of the districts of Cardiff, Pontypridd, and Merthyr Tydfil; the south-western group, of the districts of Swansea and Gower. Certain large towns situated in one or other of these areas, *viz.*, Cardiff, Rhondda, Merthyr Tydfil, Aberdare, and Swansea, have already been shown† to have suffered heavily from diphtheria in the year under notice. Taking as an aggregate the five registration districts above named, their diphtheria death-rate may be approximately stated as 900 per million, the remainder of South Wales having experienced a rate which is almost identical with the average in England and Wales, namely 240 per million.

The high average diphtheria rate in Kent was largely due to excessive fatality in the three contiguous registration districts of Dartford, Strood, and Medway, and in the district of Tunbridge. These four districts may be estimated to contain about 30 per cent. of the entire population of the county; their diphtheria mortality amounted however to more than 60 per cent. of the whole, and probably exceeded 900 per million, which is nearly four times the rate prevailing in the remainder of the county. In other parts of Kent, speaking generally, diphtheria was less fatal in the eastern than in the western districts.

Diphtheria and Croup.—Diphtheria, as a distinct affection, had scarcely been recognised in England previous to 1855, in which year this disease was, for the first time, separated from scarlet fever in the national records of causes of death.

In endeavouring to trace the changes in mortality by a given disease through a long series of years some caution is required. It must be remembered that although for many years prior to the passing of the Registration Act of 1874 medical men had voluntarily

* *i.e.*, England and Wales, less the Registration County of London.

† See Annual Summary for 1898, Tables 2 and 6.

attested the causes of a considerable number of the deaths of their patients, nevertheless, it was not till 1874 that the duty of formally certifying the cause of every death was imposed upon practitioners of medicine. There is no doubt that the Act of 1874 has greatly improved the accuracy of the national register, as the official record of causes of death, but, on the other hand, the rates of mortality before and since that year have, by that very means, become less suitable for comparative purposes. Their value, however, even for such purposes, has not been entirely destroyed, although in instituting comparison between rates of mortality for periods before and after the passing of the Act, it is obviously necessary to provide that the above-mentioned considerations shall have due weight.

With regard to the changes that have taken place from time to time in the nomenclature of diphtheria, it is important to bear in mind the following points: (a) the great diphtheria epidemic of 1858–9 was preceded by a marked increase in the mortality from croup and quinsy, by a still greater increase in the mortality from cynanche maligna, and also by some increase in that from laryngitis. (b) The diphtheria epidemic of 1863 was accompanied by parallel movements in the mortality ascribed to croup, and also in that ascribed to cynanche maligna. (c) The incidence of croup in regard both to season, and to the ages at death of those attacked, is found to have been similar to that of diphtheria. (d) Whereas the deaths attributed to croup in 1861–70 were more numerous by one-third part than those attributed to diphtheria, the deaths attributed to croup in 1896–98 were less than one-sixth part as many as the deaths attributed to diphtheria. These facts taken in conjunction, whilst they afford statistical support to the current medical opinion as to the identity of the two diseases, certainly warrant the assumption that by far the greater number of the deaths hitherto attributed to croup have really been caused by diphtheria. In addition to the 7661 deaths definitely ascribed to diphtheria in the year 1898, 863 deaths were ascribed to "croup," whilst 1189 were ascribed to laryngitis and 545 to sore throat, quinsy, &c. It is safe to assume that the greater part of the deaths referred in the certificates to croup,* as well as some of those referred to laryngitis and to ill-defined sore throat, were really due to diphtheria; and with regard to laryngitis, it may be stated that of the total deaths originally referred by medical certificate to that disease in the year 1898, at least $2\frac{1}{2}$ per cent. were proved on enquiry to have been diphtheritic in their nature.

At the present day the order of distribution of fatal diphtheria in various localities is nearly the same whether diphtheria alone or that disease and croup together be taken as the criterion, the proportion of deaths from croup being relatively so small as scarcely to affect the rate. This is especially the case in London where the mortality from "croup" barely exceeds 3 per cent. of that from diphtheria; but when it is required to compare the

* The Royal College of Physicians, in its "Nomenclature of Diseases" has never authorized the use of the term "Croup" as a synonym for laryngeal diphtheria.

present fatality of diphtheria with its fatality in earlier years, some correction is at once seen to be indispensable.

The following table gives, for each of several consecutive groups of years, and also for 1898, the average rates of mortality in England and Wales per million of the population from diphtheria and croup, separately as well as collectively, and likewise from laryngitis and from sore throat and quinsy :—

Periods.	Diphtheria.	Croup.	Diphtheria and Croup.	Laryngitis.	Sore Throat and Quinsy.
1861-70	185	246	431	51	14
1871-80	121	168	289	48	10
1881-90	163	144	307	54	24
1891-95	254	70	324	48	21
1896-97	269	43	312	44	19
1898	244	27	271	38	17

By this table it will be seen that in the twenty years 1861-80 the deaths ascribed in the registers to croup were more numerous by one-third part than those ascribed to diphtheria; but that from 1881 onwards the proportion has grown less and less, until in 1898 the deaths referred to croup did not exceed one-ninth part of the number referred to diphtheria. In Table F (pp. xxvi-xxvii) the death-rates from diphtheria and croup, both separately and collectively, are given for the several counties of England and Wales.

Careful examination of the last section of Table F reveals the following facts :—

(1.) As compared with England and Wales generally, the following counties had a mortality from diphtheria and croup together which was below the average in each of the five periods* dealt with in the table :—Berkshire, Buckinghamshire, Oxfordshire, Northamptonshire, Wiltshire, Dorsetshire, Devonshire, Cornwall, Somersetshire, Gloucestershire, Herefordshire, Rutlandshire, Nottinghamshire, Derbyshire, the East and North Ridings of Yorkshire, Durham, and Westmorland.

(2.) In the following counties the mortality exceeded the average in one only out of the five periods, and even in that period, by not more than 25 per cent. :—Hampshire, Hertfordshire, Suffolk,

* It must not be inferred from this that none of the counties included under (1) experienced excessive diphtheria mortality in any single year. As the periods dealt with in the table consist of several years apiece, excessive mortality in any one year may have been obscured by low mortality in other years of a period.

Shropshire, Worcestershire, Leicestershire, Lincolnshire, and the West Riding of Yorkshire.

(3.) Though somewhat more variable in their experience, none of the following counties suffered very heavily in any of the periods, i.e., they did not exceed the average by so much as 25 per cent. :—Surrey, Sussex, Bedfordshire, Cambridgeshire, Staffordshire, Cheshire, Northumberland, Cumberland, and Monmouthshire.

(4.) In the first period Huntingdonshire, Norfolk, and Warwickshire suffered severely, but none of these counties have suffered excessively since then.

(5.) Lancashire was among the worst counties in each of the first three periods: it now ranks among the best.

(6.) Kent, Essex, and Middlesex have suffered more severely than the average; in the later periods, the two counties first mentioned have suffered much more severely.

(7.) Wales has been very irregularly affected. Both North and South Wales experienced a mortality above the average in the first two periods, and recently, namely in 1896-98, they have again been among the counties with the highest death-rates.

(8.) London alone amongst the counties has suffered above the average mortality from diphtheria and croup in every one of the five periods; the excess has been greatest since the year 1891.

(9.) Throughout the last four periods the mortality from diphtheria and croup in extra-metropolitan England, as a whole, has been remarkably uniform, varying in the several groups of years between 261 and 288 only per million of the population.

The following table is interesting as showing the changes of fashion, with respect to the medical certification of diphtheria, which have taken place within the last 38 years in certain counties of England and Wales. The figures in each case represent the ratio of deaths certified as from croup to the deaths certified as from diphtheria, the latter taken as 100:—

Whooping-cough.—The deaths from whooping-cough in the year 1898 numbered 10,175, and were in the proportion of 324 per million of the population at all ages. This rate (with the exception of that for the year 1895) is the lowest on record, and is below the average in the preceding ten years by 89 per million. The highest county rates from whooping-cough in the year under notice were 407 per million in Cambridgeshire, 459 in Northumberland, 479 in London, 512 in Suffolk, and 558 in Cornwall. In Cumberland the rate did not exceed 47 per million, and in the adjoining county of Westmorland it was only 89. It was also very low in Berkshire, Oxfordshire, and Wiltshire.

Influenza.—10,405 deaths were referred to influenza in the year under notice. These deaths were equal to a rate of 331 per million of the population, as compared with an average rate of 256 per million in the ten years immediately preceding. Among registration divisions, influenza mortality appears to have been highest in the south-western registration division and lowest in the north-western. In London the rate was equal to 278 per million. The counties with the lowest recorded rates were Leicestershire 192, Lancashire 205, and Durham 214. The highest rates were recorded in Cornwall 744, Dorsetshire 779, Rutlandshire 794, and Herefordshire 1167 per million of the several populations.

Diarrhaea.—The deaths specifically referred to diarrhoeal diseases (*i.e.*, to diarrhoea, dysentery, and English cholera) numbered 30,096 in the year under notice, and were in the proportion of 958 per million, a rate which has only once been equalled in any year of the last fourteen.

In addition to the 30,096 deaths definitely referred to diarrhoea, dysentery, and cholera, not fewer than 16,214 were referred to enteritis. These latter deaths are equal to a rate of 516 per million living, which is the highest rate on record, and is more than double the average rate from this cause in the ten years ending with 1897. There are good grounds for the opinion that a large proportion* of the deaths returned as from enteritis would have been more correctly returned as from "epidemic diarrhoea," and the fact that the age distribution of the former disease closely corresponds to that of diarrhoea strongly supports this view.

In certifying deaths of this nature, the habit of discarding the commonplace term diarrhoea in favour of less familiar synonyms has grown more and more general during the last twenty years. So long as the substitution was limited to such expressions as "intestinal catarrh," there was no difficulty in dealing with deaths so certified; but within the last few years the use of other unauthorized synonyms has become fashionable among medical men. The terms gastro-enteritis and gastric catarrh, for example, are now used very commonly in place of diarrhoea, and inasmuch as deaths so certified are classed among affections of the digestive

* Of 2289 deaths in London classed to enteritis during the third quarter of 1899 not fewer than 1880 were certified as from gastro-enteritis, and of the latter 1750 occurred among children under 5 years old.

system, they do not appear at all in the zymotic group. Consequently the statistics with reference to a large and fatal group of epidemic diseases, which are of exceptional importance to medical officers of health, are in danger of becoming vitiated to such a degree as to be worthless* for preventive purposes.

In view of the foregoing consideration, the recent decision of the Royal College of Physicians of London on this subject may be regarded as particularly opportune.

The Royal College of Physicians, in response to an earnest appeal for its authoritative guidance concerning the certificates of death from diarrhoea, has now expressed an opinion which, if loyally adopted by medical men throughout the country, in granting certificates of death, will greatly improve the national records of mortality from this disease.

The Royal College of Physicians is convinced, after careful enquiry: (a) that various unauthorized and misleading terms, such as "gastro-enteritis," "muco-enteritis," "gastric catarrh," &c., are now commonly employed to designate the disease officially known as "epidemic diarrhoea,"† whereby its specific character is in danger of being ignored, and great confusion ensues; (b) that the present confusion of terms renders it impossible to determine accurately either the prevalence of the disease in special places and at special times, the extent to which it influences the public health, or the effects produced by sanitary measures; (c) that there is a widespread objection, on the part of medical practitioners, to the employment of the term "diarrhoea" in certifying the cause of death, probably because that term is generally held by the public to imply a mild disease, insufficient by itself to cause death.

The College, therefore, has sought to discover as an alternative for the authorized term (epidemic diarrhoea) some other name, which, whilst equally accurate, should convey to the public the idea of a more serious affection. But the College regards it as essential that the idea of specificity, intended to be conveyed by the term "epidemic," should be retained.

As the result of much deliberation, the College has agreed‡ to authorize the use of the term "epidemic enteritis" (or if preferred by the practitioner, "zymotic enteritis"), as a synonym for epidemic diarrhoea. The College has further decided to urge upon practitioners the entire disuse, in medical certificates of death, of such terms as "gastro-enteritis," "muco-enteritis," or "gastric catarrh," as synonyms of epidemic diarrhoea.

The county rates of mortality from diarrhoea, dysentery, and cholera were below 400 per million in the mainly rural areas of Westmorland, Rutlandshire, Herefordshire, Oxfordshire, and Wiltshire. In the year under notice these diseases showed, as usual,

* In certain parts of England and Wales the deaths of infants attributed to enteritis and gastro-enteritis are in the aggregate more numerous than those attributed to diarrhoea.

† Nomenclature of Diseases by the Royal College of Physicians of London, page 9, ed. 1896.

‡ The above is summarized from the minutes of the Proceedings of the Royal College of Physicians of London, January 25, 1900.

the greatest fatality in those counties which contain high proportions of urban population. Thus the rate amounted to 1269 per million in Staffordshire, 1275 in Durham, 1332 in Warwickshire, 1351 in Lancashire, and 1373 in the East Riding of Yorkshire.

Hydrophobia was the certified cause of two deaths in the year 1898, one having occurred in Kent, the other in Durham. The numbers of deaths from this disease in the five years immediately preceding had been 4, 13, 20, 8, and 6.

Puerperal fever was returned as the cause of death in 1707 instances, and other accidents of childbirth in 2367. Taken together these deaths were in the proportion of 4·41 per 1000 births. In the five years immediately preceding, the proportions per 1000 had been 6·51, 5·36, 4·57, 4·98, and 4·61.

Parasitic Diseases.—To this class of diseases 403 deaths were referred in the year under notice, being equal to a rate of 12 per million of the population, and to 0.07 per cent. of the deaths from all causes. Of the total deaths from parasitic diseases, 291 were ascribed to thrush, and the remainder to worms, hydatids, &c. (Tables 17-22.)

Dietetic Diseases.—The deaths referred to this class of diseases in the year 1898 numbered 2,854, or 0·5 per cent. of the deaths from all causes. The mortality from dietetic diseases was in the proportion of 92 per million persons living; the rate was higher than in any other year of the previous decennium, during which it averaged 79 per million. Of the total deaths in the present class, 2,464, or more than six-sevenths were directly attributed to intemperance,* *i.e.*, to “alcoholism” or to “delirium tremens.” The mortality from these causes combined was equal to a rate of 99 among males, and to a rate of 59 among females, per million living of the respective sexes; both rates being the highest on record. (Tables 17-22.)

Constitutional Diseases.—The deaths ascribed to constitutional diseases in the aggregate, amounted during the year under notice to 96,265, or 17·4 per cent. of the deaths from all causes. The mortality from diseases of this class was in the proportion of 3,066 per million persons living, a rate which is slightly below the average for the preceding decennium, viz., 3,174 per million. (Tables 17-22.)

Cancer.—To cancer, or malignant disease, there were referred 25,196† deaths, corresponding to a rate of 802 per million persons living of both sexes and at all ages. Among males the cancer death-rate was 653 per million of that sex, and among females it

* Probably many other deaths were actually caused by intemperance, although they appear in the certificates as "cirrhosis of the liver," &c.

† Of these deaths 685 were added to the total as a result of medical enquiry from this office with regard to deaths from tumour or other imperfectly specified conditions.

was 943 per million. Cancer appears to have been more fatal both among men and among women in 1898 than in any other year on record; the male rate was higher by 19·6 per cent., and the female rate higher by 10·0 per cent. than the corresponding mean rates in the preceding decennium.

Out of a total of 25,196 deaths from malignant disease, 797 were referred to scirrhus, 1,259 to epithelioma, and 1,551 to sarcoma; the remainder, amounting to 85·7 per cent. of the whole, being referred to cancer or malignant disease, without further discrimination.

Table G, from which the above details are taken, gives also the means of determining the relative frequency with which malignant disease attacks various parts or organs of the body, among males and females respectively. The part of the body affected by cancer was not stated as regards 4·6 per cent. of the male deaths, nor as regards 4·7 per cent. of the female deaths from that disease. It is well known, and is shown by the tables, that cancer is much more prevalent among women than among men, but the excess is largely due to the fact that the female generative and mammary organs are exceptionally liable to attack. As is known to have been the

TABLE H.—MEAN ANNUAL MORTALITY from CANCER, per MILLION LIVING of each SEX, at successive GROUPS of AGES, in 1891–97, and in 1898.

* i.e. the ratio of mortality in 1898 to that in 1891–97, the latter taken as 100.

case in 1897, so was it in the following year also—when the deaths from malignant affections of the ovaries, uterus, and breast were subtracted from the total deaths of females from malignant disease, the remaining deaths gave a mortality for females considerably lower than the male rate. Thus, in the year 1898, the male deaths from malignant disease, less the deaths from cancerous affections of the generative and mammary organs, were equal to a rate of 641 per million males living, whilst the female rate, with the same limitations, did not exceed 557 per million. In the previous year the corresponding figures had been 625 and 551 per million. With reference to cancerous affections of parts other than those above mentioned, it will suffice to say that the remarks appended to Table J in the report for 1897 are equally applicable to the corresponding facts in Table G of the present report. Table H shows the mortality from cancer at various ages.

Tubercular Diseases.—The deaths in the year 1898 from maladies of the tubercular class were 60,139 in number; they accounted for 10·9 per cent. of the deaths from all causes, and were equal to a rate of 1,916 per million of the population.

The deaths from *Pulmonary Phthisis* numbered 41,335, and corresponded to a rate of 1,317 per million persons living at all ages. This is the lowest rate on record, with the exception of that for the year 1896, which did not exceed 1,307 per million. In Table J (on the following page) are shown the rates of male and female mortality from phthisis at several age-groups in the year 1898, and also the average rates in the seven years immediately preceding. From this table we find that the fall in phthisis mortality, which is shown in the Report for 1897 to have progressed almost continuously during the 37 years then ended, has been maintained in the year under present notice. Phthisis was fatal to 1,514 in each million of the male, and to 1,131 in each million of the female population. Compared with the average rates in the seven years 1891–97, the mortality at all ages has been lower by 5 per cent. among males, and lower by 10 per cent. among females. The reduction of mortality has been greatest in both sexes at ages between the fifth year and the twentieth. There has been practically no reduction after the 45th year among males, but among females some irregular reduction has taken place up to the 75th year of life.

At page xxxiii. of the Sixtieth Annual Report there appeared a table giving the average rates of phthisis mortality among both sexes during 1891–97 in England and Wales and in the several counties. In the year 1898, the rates both among males and among females were considerably below the average for the previous seven years in extra-metropolitan England, whilst in London the male rate was slightly below, and the female rate decidedly below, the average. In 27 of the remaining English counties the male rates, and in all but two counties the female rates also, were below the several averages. In the three Welsh counties the male and female rates were likewise below the averages.

* i.e., the ratio of mortality in 1898 to that in 1891-97, the latter taken as 100.

The deaths referred to *Tabes Mesenterica* in the year under notice numbered 6,357, and were equal to a rate of 202 per million living at all ages. *Tabes mesenterica* is essentially a disease of childhood, the mortality in adult life being so small as to be quite unimportant. At the earlier ages this disease is much more fatal to boys than to girls. Among male children under five years the mortality was equal to 1,446 per million living, whilst among female children of the same age it was equal to 1,181 per million. These figures show in both sexes some decrease as compared with recent previous years.

The deaths referred to *Tubercular Meningitis* in the year under notice numbered 6,681, and corresponded to a rate of 213 per million at all ages, being lower than the mean rate in the preceding ten years by 6·1 per cent. Like the disease last mentioned, tubercular meningitis is mainly fatal to the young, and, in common with that disease, it is more fatal to males than to females. Among male children under five years the mortality from tubercular meningitis was equal to 1,426 per million living at that age, whilst among female children the rate was only 1,125 per million. Both these rates are below the average.

Deaths.

In the year under notice, *Diabetes* was the certified cause of 2,585 deaths, giving a rate of 82 per million persons living, which is the highest on record. The mortality from diabetes among males was equal to a rate of 94 per million, and among females to a rate of 71 per million, these rates being respectively 17·5 per cent. and 21·6 per cent. in excess of the average rates in the preceding ten years. (Tables 17-22.) In view of a steady and serious increase in the fatality of this disease during recent years, a table has been prepared for the present report showing the incidence of fatal diabetes at the several ages, both among males and among females.

TABLE K.—DIABETES MELLITUS.
MORTALITY per MILLION LIVING.

Age Groups.	Males.		Females.		Ratio.*		Mortality in 1898.	
	1861-70.	1891-97.	1861-70.	1891-97.	Males.	Females.	Males.	Females.

75 and upwards.	120	436	38	286	363	753	594	355

* i.e., the ratio of mortality in 1891-97 to that in 1861-70, the latter taken as 100.

If the seven-year period 1891-97 be compared with the decennium ending with 1870, the fatality of diabetes at all ages will be found to have exactly doubled among males, and to have fully trebled among females. The last two columns of the table further show that the fatality is still increasing. Except at the earlier ages, for which the figures are too small to give reliable rates, both sexes have experienced increased mortality from diabetes at every stage of life, the increase being progressively greater up to the 75th year. At ages above 75 diabetes now claims about as many victims as does pulmonary consumption.

Developmental Diseases.—In the course of the year 1898 there were referred to developmental diseases 50,814 deaths, which were equal to 9·2 per cent. of the deaths from all causes, and to a rate of 1,620 per million persons living. The deaths referred to old age simply were 28,698 in number, of which 12,148 were

males and 16,550 females. The mortality ascribed to old age was therefore equal among men to 799 per million living and among women to 1,023 per million. (Tables 17-22.) To premature birth 18,352 deaths were referred, a number equal to 19·88 per thousand children born, which is the highest proportion on record. The mortality ascribed to congenital defects was equal to 4·08 per thousand births, as compared with an average of 3·78 per thousand in the preceding ten years.*

Local Diseases.—The deaths in the year 1898 from diseases of the local class numbered 271,733, or 49·2 per cent. of the deaths from all causes; they were equal to a rate of 8,652 per million of the population, as compared with 9,459, the average rate in the ten years immediately preceding. Diseases of the nervous system (exclusive of convulsions) caused 46,481 deaths, corresponding to a rate of 1,481 per million persons living; the male rate was 1,524 per million or 9·0 per cent. below, and the female rate was 1,440 per million or 8·1 per cent. below, the decennial average. Diseases of the circulatory system accounted for 50,492 deaths, which were equal to a rate of 1,607 per million persons living; the mortality among males was 1,583 per million, or 3·8 per cent. below the average, and among females it was 1,631 per million or 3·7 per cent. below the average. The deaths referred to diseases of the respiratory system (exclusive of croup) numbered 90,803, and corresponded to a rate of 2,892 per million persons living; among males the rate was equal to 3,159, and among females to 2,640 per million, the rates being, with one exception, lower than the corresponding rates in any previous year in the tables. Diseases of the urinary system accounted for 14,598 deaths, and for a rate of 465 per million of the population; among males the rate was 578 per million and among females 357 per million, both these rates being somewhat higher than the respective averages.

Violence.—17,084 persons met their death by *accident* or *negligence* during the year under notice, the rate of mortality from this cause being 544 per million, which is slightly below the average. Among males the rate was 778 per million or 3·5 per cent. below the average, and among females it was 325 per million which corresponded closely with the average. The deaths of 2,166 males and 711 females were attributed to *suicide*, these figures being in both cases somewhat in excess of the annual average, corrected for increase of population. 162 males and 145 females fell victims to *homicide*, these numbers corresponding with the annual average, corrected as before stated. In 178 of the cases of homicide the verdict of the coroner's jury was *murder*; in the remaining 129 cases, *manslaughter*. There were 10 *executions* in the year under notice, the numbers in the three preceding years having been 10, 20, and 7.

Ill-defined and Not Specified Causes.—The causes of 23,039, or 4·2 per cent. of the total deaths, were so unsatisfactorily stated in the registers as to be useless for purposes of classification. Among males the proportion of such cases was as high as 4·5 per cent., whilst among females it was 3·9 per cent. The disproportion

* Cf. Table M, page xxvii of 59th Annual Report.

presented by the figures for the two sexes may easily be shown to be only apparent. The percentage of ill-defined and undefined causes of death among infants under one year of age was 13·6 for males and 13·5 for females; among children between one and five years of age it was 1·8 for males and 1·9 for females; whilst among persons above the age of five years it was 0·6 for males and 0·5 for females. The disproportion between the sexes with respect to their mortality at all ages from non-specified causes therefore depends on the fact that in the first year of life, the period when the percentage of ill-defined causes is at its highest, male infants die more rapidly than female. In the year 1881, when the present system of classification was instituted, the proportions of ill-defined and not specified causes for both sexes taken together were:—At ages under one year, 17·9 per cent.; between one year and five years, 3·8 per cent.; and at ages above five years, 2·3 per cent. Comparing these figures with those already given for 1898, it appears that the proportion has decreased during the interval by about one-fourth among infants under one year, by one-half among children from one year to five years, and by rather more than three-fourths among persons above five years of age. This reduction is in great part due to the system of medical enquiry respecting deaths attributed to dropsy, mortification, tumour, haemorrhage, and other ill-defined conditions. In many instances our enquiries have given medical practitioners an opportunity of furnishing information which had inadvertently been omitted in the original certificates, or which had been more recently acquired by *post-mortem* examination.

The following figures indicate approximately the results achieved by the system of medical enquiries, concerning the ill-defined group of causes of death, since the year 1881:—

CAUSE OF DEATH.	PER CENT. OF TOTAL DEATHS.		
	In 1881.	In 1898.	
		As originally Returned.	As Corrected after Enquiry.
Dropsy	383	·070	·034
Debility, Atrophy, Inanition	4,614	3·694	3·687
Mortification	115	·026	·006
Tumour	·072	·046	·015
Abscess	·129	·067	·067
Haemorrhage	·032	·028	·020
Sudden (cause unascertained).	·075	·036	·036
Other Ill-defined and not specified causes.	·724	·315	·308

The high proportion contributed to the ill-defined group of causes, by the deaths which for want of a better name have to be classed to "Atrophy or debility," will surprise no one who is familiar with the conditions of medical practice among the poor. Deaths entered in the Register as due to atrophy or debility are classed accordingly, without further enquiry, except in the case of persons neither very old nor very young at the time of death. Certificates thus worded, in the case of infants are accepted without question as being the only information which, under the circumstances, is likely to be obtained; whilst in the case of aged persons the term atrophy is regarded as a synonym for senile decay. It is therefore not surprising that the deaths thus designated are disappearing from the ill-defined class much more slowly than the deaths under any other heading in the list. In the course of the last 17 years the reduction in mortality from atrophy and debility has not exceeded one-fifth part. The heading "Abscess" has never been made the subject of enquiry by this office; the satisfactory reduction therefore in the deaths thus returned must be attributed to increased care in filling up the certificates. The expression "Sudden death" (without statement of cause) does not occur in medical certificates; and as uncertified sudden deaths are reported to coroners, the reduction of more than half under this heading must be set down to the credit of coroners' juries. The great majority of deaths which appear under the headings "Haemorrhage" and "Other ill-defined and not specified causes" consist either of inquest cases, or of uncertified deaths concerning which coroners have refused to hold inquests.

The total number of answers received from medical practitioners for the purposes of the present Report was 4,104, and of these scarcely more than 700 related to such ill-defined causes as dropsy, mortification, &c. Nearly 3,400 other answers related to certificates in which some definite information as to cause of death had been given, although there was reason to doubt whether the primary cause had been specified with sufficient clearness.

It may be useful to enumerate a few of the difficulties met with in classifying deaths which have been certified by medical practitioners. For instance, when either pyæmia or septicæmia, either peritonitis or metritis, appears as the cause of death of a woman of childbearing age, it is important to ascertain whether or not the fatal issue had been associated with parturition. When a death is stated to have been due to tumour or new growth in the brain, liver, uterus, or other organ, the classification of the death depends on the nature of the tumour. The expression "spinal disease" may refer in one case to an affection of the vertebral column, in another to an affection of the spinal marrow. Again, the term laryngitis may indicate either a diphtheritic or a non-diphtheritic malady; and "typhoid pneumonia" (a term which has now become almost obsolete) in some cases is found to mean enteric fever accompanied by pneumonia, and in other cases simply asthenic pneumonia. In cases like the above it is our practice to communicate with the certifying practitioner requesting further

information, and this, in nearly all cases, is courteously and promptly rendered.

Of the 4,104 answers received during the year under notice, 2,938, or nearly 72 per cent., contained information which has been utilised to amend the classification of death causes.

The following is a summary of the results of enquiries, under a few of the principal headings:—

Subject of Enquiry.	No. of Answers Received.	Amended Classification as result of Enquiry.
"Tumour" of specified organ (nature of tumour not stated).	958	{ 412 to Cancer. 68 " Syphilis. 74 " Tuberculosis. 16 " Other definite causes.
"Tumour," organ not specified.	194	{ 109 to Cancer. 25 " Ovarian Disease. 14 " Disease of Uterus. 26 " Other definite causes.
Pyæmia, Septicæmia.	291	{ 30 to Puerperal Fever. 8 " Venereal Disease. 8 " Tuberculosis. 23 " Diseases of Integumentary System. 16 " Diseases of Locomotor System. 61 " Results of Injury. 55 " Other definite causes.
Peritonitis, Pelvic Cellulitis, Metritis.	454	{ 101 to Puerperal Fever. 18 " Tubercular Peritonitis. 8 " Venereal Disease. 92 " More Definite Diseases of Digestive System. 36 " More Definite Diseases of Generative System. 32 " Other definite causes.
Syncope	392	{ 193 to More Definite Diseases of Circulatory System. 37 " Alcoholism. 21 " Diseases of Nervous System. 20 " Diseases of Respiratory System. 74 " Other definite causes.

The total additions to certain of the principal headings in the tables were as follows:—To cancer 685 deaths, to puerperal fever 131, to syphilis 91, to alcoholism 84. In 112 instances the condition stated in the certificate was found to have been primarily due to accident, whilst in 164 other instances in which such indefinite terms as "fracture," "injury," &c., had been used in the certificate, the deaths were ultimately classed according to the nature of the injury.

CERTIFICATION OF CAUSE OF DEATH.

Of the 552,141 deaths recorded in England and Wales during the year under notice, the causes of 507,541, or 91·92 per cent., were certified by registered medical practitioners; inquests were held respecting 34,159, or 6·19 per cent.; whilst the remaining 10,441, or 1·89 per cent., were altogether uncertified.

In making this statement it is important to allow for the fact that irrespective of the 507,541 persons certified to have died under medical care, there died an unknown but perhaps relatively small number who in their last illness had been attended by qualified though unregistered practitioners. Again, the figures require considerable modification on account of the cases in which inquests were held on persons under medical care at the time of death. Such deaths, although actually occurring under medical care, are placed under the head of "inquests," and consequently do not appear in the medically certified list. It has been stated above that in the year under present notice not fewer than 34,159, or 6·19 per cent., of the total deaths in England and Wales, were certified by coroners after inquest. There is no doubt that in a large proportion of these cases medical evidence as to cause of death (with or without post-mortem examination of the body) was taken at the inquest; but except in cases where a post-mortem examination is stated in the coroner's certificate to have been made, it is impossible to ascertain whether or not medical evidence was given at the inquest, and, if given, what was the purport of that evidence. In the third quarter of the year 1897, there were held in England and Wales 8,957 inquests, and on examining the returns in this Office it appears that the coroners' certificates contain intimation of post-mortem examination having been made regarding 14 per cent. only of that number.

Unfortunately the verdicts of coroners' juries are frequently worded in such a manner as to obscure the medical evidence given at the inquest concerning the cause of death, and this information is consequently lost for the purposes of vital statistics. That the reliability of the national system of death registration should be seriously impaired by such means is much to be regretted, inasmuch as a large share of the time of our official staff is occupied in the endeavour to maintain that system in a high degree of efficiency. It is obvious, however, that the result of these efforts will be to a large extent neutralized, unless means can be found to prevent the loss of essential information after the manner above indicated.

As this question has incidentally occupied the attention of the Home Office of late, in the course of an investigation into the alleged danger of poisoning by water gas, it may be well to insert here an extract from the report of a Departmental Committee of that Office dated 17th January, 1899:—

" Lastly, we are so much impressed by the insufficiency and "untrustworthiness of the statistics relating to particular causes of "mortality which can be gathered from returns of coroners' "verdicts, that we venture, though the matter is outside the terms

" of reference to us, to recommend strongly that some steps "should be taken to secure that these verdicts should lend "themselves more readily to clear classification by the Registrar- "General; and, in particular, we suggest that in every case where "the coroner is in possession of a medical certificate of death, "or where medical evidence has been taken at the inquest, a "copy of that certificate or an abstract of that evidence should "be appended to the coroner's certificate when sent to the "Registrar-General."*

If effect were given to this reasonable suggestion, it is certain that a marked improvement would speedily appear in the national records of causes of death.

The extent to which medical aid is administered to the dying varies considerably at different ages, as well as in different parts of the country. The minimum amount of such protection is expressed in Table L by the percentages of total deaths that have

* Report of the Departmental Committee, *re Water Gas*, p. xi [C. 9164] 1899

been medically certified at the several ages; but these figures by no means represent the actual proportions of the community that are thus cared for in their last illness: for as has already been explained, we have, at present, no means of determining how many of the persons on whose bodies inquests are held, had actually been under medical care at the time of death.

The proportion of medically certified deaths of males during 1898 was 90·27 per cent., and that of females 93·67 per cent. (Table L.) This difference is mainly attributable to the greater liability of males than of females to death as a result of accident. Nearly all such deaths are registered on the information of coroners after inquest; but it may safely be assumed that medical aid is given in the majority of cases of serious accident, excepting those in which death ensues immediately. It will be seen that at ages under five years the proportion of medically certified deaths differs but little in the two sexes. Between 5 and 65 years of age, however, the proportion among males falls much below the proportion among females, the difference being greatest at ages 15 to 25. Reference to the figures relating to inquests in the table shows, however, that it is precisely at these ages that males are most liable to death from causes which become the subject of coroners' enquiries. If we exclude from consideration all deaths from violence, it will be found that the causes of 94·7 per cent. of the deaths of males, and of 95·7 per cent. of the deaths of females, occurring at all ages in 1898 from what are known as "natural causes" were certified by registered medical practitioners; at ages 15 to 25 years the corresponding proportions were 96·4 per cent. among males and 97·1 per cent. among females. Examination of the foregoing figures makes it probable that, cases of violence being excepted, the two sexes receive medical aid during their last illness in about equal proportion; any difference that may exist being slightly in favour of females.

The following table shows the proportions of medically certified deaths, inquest cases, and uncertified deaths in those parts of London lying respectively north and south of the Thames, and also in each Registration County outside London.

In London north of the Thames 89·79 per cent. of the deaths during the year were medically attested; in London south of the Thames the percentage was 91·02. The county showing the lowest proportion of deaths medically attested was that of Hereford, where the percentage was 89·76; the highest proportions being 93·05 in Westmorland, 93·10 in Monmouthshire, and 94·78 in Rutlandshire. It therefore appears that between the highest and the lowest figures the range did not exceed 5 per cent.

There does not appear to have been any great increment in the amount of protection thus afforded to the community generally within recent years. Unfortunately the records of death-certification in England and Wales are not available for years prior to 1878; but if the twenty years, 1878-97, be divided into quinquennial periods it appears that the proportion of deaths medically certified in the earliest of these periods averaged 90·47, whilst in the latest

1898	91·92	6·19	1·89

Coroners' inquests were held in the course of the year under notice on the deaths of 34,159 persons, namely, 22,015 males, and 12,144 females. In England and Wales, as a whole, the inquest cases constituted 6·19 per cent. of the total deaths. The proportion varied greatly in different parts of the country; in North Wales the percentage was 3·71, in Westmorland 3·97, and in Herefordshire and Rutlandshire 4·12, whilst it ranged upwards to 6·60 in Cheshire, 6·99 in Wiltshire, 7·04 in the East Riding of Yorkshire, 7·43 in Southern London, 7·92 in Gloucestershire, and 10·10 in Northern London. In Table O, as in a corresponding table in the last Annual Report, the inquest cases have been arranged with respect to age and sex, and also with respect to cause of death as specified in the verdicts of the Coroners' juries. A special classification has been adopted in the present table for the purpose of showing to what extent the findings of Coroners' juries can be utilized for statistical purposes.

* Persons "found dead" in water or on the shore, and children "found dead" in bed without statement as to cause of death, are classified under heading Violence (c).

These deaths may be roughly grouped as follows :—In 29,286 instances, or 86 per cent. of the whole, the causes of death were so stated in the certificates as to admit of classification, whilst in the remaining 4,873 instances, or 14 per cent., the returns were unsatisfactory and useless for statistical purposes. The terms "convulsions" and "syncope," are properly included in the first category, because they are so contained in the official tables of causes of death. They cannot, however, be regarded as scientific expressions, and it is to be regretted that, on the average, nearly one-sixth part of the deaths from so-called "natural causes" * regarding which inquests take place should be thus returned. Of the 15,219 deaths from natural causes, on which inquests were held in the year under notice, the causes of 2,343 deaths, or 15 per cent., were attributed by coroners' juries to "heart failure," "syncope," or "convulsions," without statement of definite disease, and the causes of 1,516 other deaths, or 10 per cent., were so returned that they could be relegated only to the indefinite class. In some counties, among which may be mentioned London, Wiltshire, Devonshire, Somersetshire, Gloucestershire, Leicestershire, and the East Riding of Yorkshire, the ill-defined cases formed but a small proportion of the inquests on deaths from natural causes ; but in other counties, for example, in Berkshire, Norfolk, Cornwall, Shropshire, Lancashire, Cumberland, and North Wales, they ranged from 23 to 44 per cent.

The causes were fairly indicated in 15,583, or 82 per cent., of the 18,940 violent deaths on which inquests were held in the year 1898, whilst in regard to the remaining 3,357 violent deaths the information was more or less defective. In some cases of violent death the evidence is insufficient to determine whether the fatal issue has resulted from accident on the one hand, or from intent on the other. Many verdicts contain intimation to this effect, and in such cases the defect is obviously inevitable. But there is another kind of defect which attaches to a large number of coroners' certificates, and which would appear to be generally avoidable. Very common in some districts are verdicts of "accidental death" and "death from injury," without mention of cause or nature. At the very least it is desirable to know whether the death was caused by casualty in a mine, on the railway, in a factory, in the street, or otherwise ; and further, whether it resulted from an explosion, from a fall, from the impact of some heavy substance, from burn, from scald, or from other means.

As might have been expected, the character of the verdicts of coroners' juries varies greatly in different parts of the country. For example, in Kent and in some other counties bordering on the sea, there is a large excess of "open verdicts" on persons found drowned, the juries being apparently unable to determine whether the drowning was accidental or otherwise. In London and in certain other counties satisfactory information as to the cause of violent deaths is generally given in coroners' certificates,

* i.e., causes other than violence.

but in most of the south Midland Counties (notably in Northamptonshire) as well as in Staffordshire, Nottinghamshire, the North Riding of Yorkshire, and Northumberland, large proportions of the violent deaths are returned as "accidental," or in some other manner equally unsatisfactory, no indication as to the cause or nature of the accident being derivable from the certificates.

Inasmuch as the verdicts of juries are our only source of information respecting deaths which are the subject of inquest, it will readily be understood that defects such as those above referred to are of serious importance in relation to the national registration of cause of death.

It has previously been stated that in the year under notice the deaths of 10,441 persons, or 1·89 per cent. of the total deaths, were registered as uncertified. This is the lowest proportion on record, the figures having steadily declined from 4·85 per cent. in 1878 to 2·06 per cent. in 1897. (Table N.)

Table M shows the proportion of uncertified deaths registered in England and Wales, in the parts of London north and south of the Thames, and in each county outside London, according as they were or were not referred to coroners before registration. In England and Wales the average proportion of uncertified deaths in the year 1898 was 1·89 per cent. In the several counties the lowest percentages were 0·11 in Northern London, 0·78 in Monmouthshire, 0·87 in Wiltshire, and 0·90 in the East Riding of Yorkshire ; the highest percentages were 3·14 in Cornwall and in Derbyshire, 3·16 in Shropshire, 3·17 in Cheshire, 3·30 in Kent, 4·22 in North Wales, and 6·12 in Herefordshire.

In Table P these deaths are grouped according to age and assigned cause. This table shows that 7,940, or rather more than three-fourths of the uncertified deaths, were registered as such after reference to coroners, but without inquest. The remaining 2,501 deaths, which had neither been certified nor referred to coroners, include the following :—(a) Cases attended by qualified though unregistered medical practitioners, (b) cases informally attested,* (c) cases attended by midwives, and (d) cases that had received no skilled attendance in their last illness.

A high proportion of uncertified deaths in a given locality does not necessarily indicate official laxity in regard to the registration of deaths ; for the table shows that the highest percentages of deaths neither medically certified nor reported to coroners occurred in Cornwall, the North Riding of Yorkshire, Durham, Bedfordshire, Herefordshire, Huntingdonshire, and North and South Wales ; but this list includes only three (viz., Cornwall, Herefordshire, and North Wales) of the seven counties with the highest proportions of uncertified deaths. Closer examination of

* In some of these cases an informal statement of the probable cause of death was made by a registered medical practitioner, who had either attended the deceased in a previous illness, or had been called in only when the patient was moribund. In other cases the practitioner in attendance was unqualified.

the table confirms this inference. For there are thirty counties in which the proportions of uncertified deaths during 1898 exceeded the average for England and Wales, and in not fewer than twelve of these counties* the proportion of deaths neither certified nor reported to coroners was below the average. This is not a mere coincidence, inasmuch as a similar relation was established for nearly the same counties in the Sixtieth Annual Report.†

It has been noted in previous Reports that uncertified deaths are commonly most numerous among infants, and least numerous among persons at ages from 15 to 25 years, the proportion again increasing steadily at more advanced ages. Substantially similar results are shown by the figures for the year under present notice. There is, however, a remarkable difference between the age distribution of the 7,940 uncertified deaths which were referred to coroners and that of the 2,501 deaths which were not so referred. Of the former 25 per cent. were deaths of infants under three months old, 16 per cent. those of infants from three to twelve months, 36 per cent. those of persons of ages between one year and sixty-five years, and 23 per cent. those of persons above five years of age. Of the latter as many as 55 per cent. were deaths of infants under three months, whilst only 11 per cent. were those of other infants under one year, 18 per cent. those of persons between one year and sixty-five years, and 16 per cent. those of persons above sixty-five.

The same facts are shown from another point of view in Table L, in which 100 deaths at each of the age-groups are divided out according to the form in which the cause of death was stated to the Registrar. It may be noted that about 2 per cent. of the deaths of infants under three months are registered without either medical certificate or reference to Coroners, but at no other age period does the proportion exceed 0·35 per cent. It further appears that at most age periods between one year and sixty-five years the proportion falls even below this figure. The proportions of uncertified deaths were less at nearly all age-groups in the year 1898 than they had been in 1897.‡

Uncertified deaths which have been referred to Coroners are, on the average, about thrice as numerous as those which have not been so referred; and under several of the headings in Table P (e.g., measles, whooping cough, diarrhoeal diseases, old age, and convulsions) the ratio of referred to unrefereed cases does not greatly differ from this. The unrefereed deaths from apoplexy and from heart disease were respectively only one-seventh and one-ninth part as numerous as the deaths that were referred; whilst on the other hand the unrefereed deaths from premature birth, and from atrophy or debility were nearly equal in number

* Viz., the counties of Kent, Buckingham, Cambridge, Essex, Dorset, Devon, Worcester, Warwick, Lincoln, Nottingham, Lancaster, and Cumberland.

† Cf. Table R, page xli.

‡ See Sixtieth Annual Report, page xlvi, Table U.

to the referred deaths. The causes of 583 uncertified deaths were stated too indefinitely to admit of any useful grouping; nearly all of these latter deaths were, however, referred to Coroners before registration.

OFFENCES AGAINST THE REGISTRATION ACTS.

In 1898, 22 persons, on prosecution by order of the Registrar-General, were convicted of different offences against the Registration Acts, as under :—

For giving false information for registration ...	6
For giving false information for the registration of adopted children	7
For personating a qualified informant at registration	2
For failing to comply with requisition to register	1
For making and giving a false certificate of cause of death	1
For burying as stillborn the bodies of children that had lived	2
For procuring to be buried as stillborn the body of a child that had lived	1
For presenting a false and forged medical certificate at the registration of a death ...	1
For causing two bodies in one coffin to be buried without the requisite authority for burial ...	1

In addition to the foregoing, two cases of conviction were obtained by the Public Prosecutor—one in respect of the false registration of an adopted child, and the other regarding a false declaration made and a forged consent produced on giving notice for marriage to a Superintendent Registrar. Two cases of conviction were also obtained by coroners—one against a medical practitioner for refusing to issue a medical certificate in a case attended by him, on the ground that his fees had not been paid, and the other in respect of the issue of a false medical certificate.

PROGRESS OF REGISTRATION.

The names in the alphabetical indexes of births, deaths, and marriages recorded in the national registers of England and Wales were increased during the year 1898 by 1,986,164, this addition raising the aggregate number of names in the indexes, which at the end of 1898 embraced a period of 61½ years, to 96,718,387.

SEARCHES AND CERTIFICATES.

Besides the certified copies of the registered births, deaths, and marriages kept in England and Wales pursuant to the Registration Acts of 1836 and 1874, a large number of other registers and records are deposited in the custody of the Registrar-General under statutory and other arrangements. A list of all these various registers and records will be found on pages xxix-xxxii of the Fifty-eighth Report. Searches may be made in any of these registers and certificates obtained of entries found, on payment of the prescribed fees.

During the 52 weeks ending 31st December 1898 the total number of searches was 63,825, and certificates were issued to the number of 41,143; the total amount received in fees for searches and certificates was 8,450*l.* 19*s.* 6*d.*

The following figures indicate that as time progresses the records in this Office are being utilized by the public more and more extensively for legal evidence of births, deaths, and marriages.

Years.	Total Searches.	Certificates Issued.	Amount Received.
1866 (complete year) ...	12,135	10,017	1,860 15 6
1875 (52 weeks)	26,356	20,282	3,879 15 6
1885 (52 weeks)	36,450	27,682	5,317 13 6
1895 (52 weeks)	53,289	35,727	7,200 12 6
1896 (53 weeks)	57,444	37,435	7,600 0 6
1897 (52 weeks)	58,664	37,485	7,686 8 6
1898 (52 weeks)	63,825	41,143	8,450 19 6

MORTALITY IN THE ARMY.*

The average strength of the Army at home and abroad in 1898 was 225,027, and the deaths during the year were 2,699, giving a death-rate of 12·0 per 1000 against 8·3, 8·4, and 10·0 in the preceding three years. The mortality in the Army abroad was 18·3

* Based upon returns furnished by the Commander-in-Chief.

per 1000, against an average of 12·6 per 1000 in the five years 1893-97, while that in the Army at home was 4·4 per 1000, against an average of 4·5 in the same five years. (Table 34.)

MORTALITY IN THE NAVY.*

The average force afloat was 82,830. The deaths during the year numbered 407, being in the proportion of 4·9 per 1000 of the strength. Of the 407 deaths, 295 were due to disease and 112 to violence; the death-rate from disease was therefore 3·6 per 1000, and that from violence 1·3 per 1000. Of the 112 deaths from violence, 104 were accidental and 8 were suicidal; the accidental deaths include 58 from drowning and 5 from heat-stroke.

BIRTHS AND DEATHS OF BRITISH SUBJECTS AT SEA.

Marine Register Book.—In accordance with the Births and Deaths Registration Act of 1874 and the Merchant Shipping Act of 1894, Commanding Officers of Ships trading to or from British Ports are required, under penalty, to transmit returns of all births and deaths occurring on board their ships to the Registrar-General of Shipping and Seamen, who furnishes certified copies of such returns to the Registrars-General of England, Scotland, and Ireland. Similar returns are furnished by persons having charge of Her Majesty's Ships directly to the Registrars-General of Births and Deaths. These returns of births and deaths at sea constitute the "Marine Register Book." During the year 1898, this book was increased by the addition of 173 entries of birth and 2,578 entries of death.

Mercantile Marine.—The Registrar-General of Shipping and Seamen reports that the number of masters and seamen afloat during the year 1898, in vessels belonging to the Mercantile Marine of the United Kingdom (including the islands in the British seas) and registered under the Merchant Shipping Acts, was 231,385, being 2,395 less than in the preceding year. The reported deaths numbered 2,637, showing a rate of 11·4 per 1000 of the strength. This rate was 1·8 per 1000 below the mean rate in the five years 1893-97. (Table 36.)

Among passengers on board merchant vessels at sea 47 births and 409 deaths were reported in 1898; the births were 3 below, and the deaths 83 above the numbers reported in the preceding year. (Table 37.)

INTERNATIONAL VITAL STATISTICS.

In Tables 44-61 will be found international statistics concerning the marriages, births, and deaths in the United Kingdom and in the principal States on the continent of Europe. In all the foreign countries from which returns for the year 1898 have been received, except Switzerland, the birth-rates during that year were lower than the respective averages for the 27 years 1871-97; but the rates in Denmark, Norway, Switzerland, the German Empire, and Prussia showed an increase on the figures for the year 1897. The death-rates of all the countries were considerably below the averages for the preceding 27 years, but those of Switzerland, the Netherlands, Belgium, France, and Italy were above the corresponding figures for the year 1897.

I have the honour to be,
Sir,
Your faithful Servant,

BRYDGES P. HENNIKER,
Registrar-General.

General Register Office, Somerset House,
9th December, 1899.

* From the Statistical Report of the Health of the Navy for the year 1898.

REMARKS ON THE METEOROLOGY OF THE YEAR 1898.

By JAMES GLAISHER, Esq., F.R.S., &c.

The following remarks, both with regard to atmospheric pressure and temperature, are based on observations made near London, but they may be taken as having a general application :—

Atmospheric Pressure.—The readings of the barometer were below their averages on January 1st and 2nd, being as much as 0·66 in. below on the 1st, the mean daily deficiency was 0·42 in.; from January 3rd to February 1st it was above, being particularly so from January 11th to the 29th, the mean daily excess for these 19 days being 0·59 in., and for the 30 days ending February 1st was 0·45 in.; from February 2nd to the 7th it was below, being as much as 0·55 in. below on the 4th, the mean daily deficiency was 0·18 in.; from February 8th to the 17th it was above, the mean daily excess being 0·24 in.; from February 18th to April 3rd it was generally below, the mean daily deficiency being 0·15 in.; from April 4th to the 8th it was above, the mean daily excess being 0·22 in.; from April 9th to the 15th it was generally below, the mean daily deficiency being 0·10 in.; from April 16th to the 25th it was generally above, the mean daily excess being 0·11 in.; from April 26th to May 5th it was below, the mean daily deficiency being 0·30 in.; from May 6th to the 9th it was above, the mean daily excess being 0·22 in.; from May 10th to the 15th it was below, the mean daily deficiency being 0·29 in.; from May 16th to the 18th it was above, the mean daily excess being 0·26 in.; from May 19th to June 6th it was generally below, the mean daily deficiency being 0·11 in.; from June 7th to the 21st it was above, the mean daily excess being 0·19 in.; from June 22nd to the 27th it was below, the mean daily deficiency being 0·26 in.; from June 28th to August 5th it was generally above, the mean daily excess being 0·13 in.; from August 6th to the 8th it was below, the mean daily deficiency being 0·15 in.; from August 9th to the 26th it was generally above, the mean daily excess being 0·12 in.; from August 27th to the 30th it was below, the mean daily deficiency being 0·12 in.; from August 31st to September 6th it was above, the mean daily excess being 0·22 in.; from September 7th to the 12th it was below, the mean daily deficiency being 0·07 in.; from September 13th to October 12th it was generally above, the mean daily excess being 0·16 in.; from October 13th to the 21st it was below, being as much as 0·72 in., 0·84 in., 0·94 in., and 0·86 in. below on October 15th, 16th, 17th, and 18th respectively; from October 22nd to the 28th it was above, the mean daily excess being 0·13 in.; from October 29th to November 5th it was generally below, the mean daily deficiency being 0·18 in.; from November 6th to the 22nd it was generally above, the mean daily excess being 0·19 in.; from November 23rd to December 3rd it was generally below, being as much as 0·93 in., 0·98 in., and 0·84 in. below on November 24th, 25th, and 26th respectively; the mean daily deficiency for the 11 days ending December 3rd was 0·46 in.; from December 4th to the 26th it was generally above, the mean daily excess being 0·23 in.; and from

December 27th to the 31st it was below, being as much as 0·99 in. below on the 29th, the mean daily deficiency for the 5 days ending December 31st being 0·53 in.

The highest reading of the barometer at the height of 159 feet above the sea was 30·520 ins. on January 28th; and the lowest was 28·590 ins. on October 18th. The yearly range was 1·930 inch.

Temperature.—The temperature of the air was generally above its average from January 1st to February 3rd, being particularly so on January 5th, 6th, 19th, 20th, 21st, 22nd, 30th, and on February 1st, the mean daily excess for these 8 days was 12°, and the mean daily excess for the 34 days ending February 3rd being 5°·1; from February 4th to the 7th it was generally below, the mean daily deficiency being 1°·9; from February 8th to the 17th it was above, being as much as 8°·4, 9°·2, and 9°·3 in excess on February 10th, 12th, and 15th respectively, the mean daily excess for the 10 days ending February 17th being 5°·7; from February 18th to the 25th it was below, the mean daily deficiency being 2°·9; from February 26th to March 1st it was above, the mean daily excess being 1°·2; from March 2nd to the 13th it was below, the mean daily deficiency being 3°·4; from March 14th to the 19th it was above, being as much as 11°·5 in excess on the 18th, the mean daily excess being 5°·8; from March 20th to April 5th it was generally below, being as much as 8°·5 and 9°·2 below on March 24th and 25th respectively; the mean daily deficiency for the 17 days ending April 5th was 3°·6; from April 6th to the 17th it was generally above, being as much as 9°·8 and 8°·5 in excess on the 8th and 9th respectively, the mean daily excess being 4°·1; from April 18th to the 25th it was generally below, the mean daily deficiency being 2°·9; from April 26th to May 10th it was generally above, the mean daily excess being 10°·6; from May 11th to June 4th it was generally below, being as much as 8°·3, 9°·7, and 7°·7 below on May 19th and June 1st and 2nd respectively, the mean daily deficiency for these 26 days being 2°·7; from June 5th to the 11th it was generally above, the mean daily excess being 2°; from June 12th to the 16th it was below, the mean daily deficiency being 6°·5; from June 17th to the 21st it was above, the mean daily excess being 4°·1; from June 22nd to July 14th it was generally below, being as much as 8°·6 and 9° below on June 26th and July 10th respectively; the mean daily deficiency for the 23 days ending July 14th was 2°·6; from July 15th to the 27th it was generally above, the mean daily excess being 1°·4; from July 28th to the 31st it was below, the mean daily deficiency being 4°·3; from August 1st to the 6th it was generally above, the mean daily excess being 1°·8; from August 7th to the 10th it was below, being particularly so on August 7th and 8th, when it was as much as 10°·3 and 9° below, the mean daily deficiency being 6°·9; from August 11th to September 23rd the weather was remarkably fine, bright, and hot, and the mean temperature of the air was generally above its average, being particularly so on August 13th, 14th, 15th, and 22nd, and on September 4th, 7th, 8th, 9th, 16th, and 17th, when it was as much as 11°, 10°·2, 12°, 11°, 10°, 11°·6, 17°·7, 16°·8, 12°·1, and 17°·5 respectively above; and on several other days during this period the temperature was as much as 8° and 9° in excess of its average, the mean daily excess for the 44

days ending September 23rd being $6^{\circ}2$; from September 24th to October 2nd it was below, the mean daily deficiency being $1^{\circ}9$; from October 3rd to the 9th it was above, the mean daily excess being $3^{\circ}6$; from October 10th to the 13th it was below, the mean daily deficiency being $2^{\circ}6$; from October 14th to November 21st it was generally above, being particularly so on October 21st, 22nd, 26th, 27th, and 29th, and on November 16th and 17th, when it was as much as $10^{\circ}8$, $12^{\circ}6$, $9^{\circ}6$, $9^{\circ}4$, $9^{\circ}4$, $10^{\circ}5$, and $9^{\circ}6$ respectively in excess; the mean daily excess was $5^{\circ}3$; from November 22nd to the 30th it was generally below, the mean daily deficiency being $2^{\circ}1$; from December 1st to the 19th the weather was remarkably mild, and the temperature of the air above its average, being particularly so on December 1st, 2nd, 3rd, 4th, 5th, 6th, 10th, 11th, 12th, 17th, and 18th; the mean daily excess for these 11 days was $11^{\circ}9$, and for the 19 days ending December 19th being $8^{\circ}8$; from December 20th to the 24th it was below, the mean daily deficiency being 2° ; from December 25th to the 29th it was above, being as much as $9^{\circ}4$ and $11^{\circ}3$ in excess on the 26th and 27th respectively, the mean daily excess being $7^{\circ}3$; and on December 30th and 31st it was below, the mean daily deficiency being $1^{\circ}3$.

The highest temperatures of the air were at the Royal Observatory $92^{\circ}1$, at Barnet $91^{\circ}8$, and at Camden Square $91^{\circ}2$; the lowest were at Barnet 16° , at Llangammarch Wells 17° , and at Croydon $19^{\circ}8$.

Rainfall.—The fall of rain was below its average in each of the months of January, February, and March; the total fall in the three months at Greenwich was $3^{\circ}24$ ins., or $1^{\circ}71$ in. below the average, and there were only ten instances of as small or smaller fall for these three months back to 1815, viz.:

1892	it was	Ins. $3^{\circ}16$	1874	it was	Ins. $2^{\circ}40$	1850	it was	Ins. $2^{\circ}80$
1887	"	$3^{\circ}03$	1859	"	$3^{\circ}10$	1829	"	$2^{\circ}40$
1880	"	$3^{\circ}20$	1854	"	$3^{\circ}10$	1822	"	$3^{\circ}20$
1878	"	$3^{\circ}10$						

The fall of rain was below its average in April, above in May, and below again in June; the total fall in the three months at Greenwich was $5^{\circ}32$ ins., or $0^{\circ}29$ in. below the average. The fall of rain was below its average in each of the months of July, August, and September; the total fall in the three months at Greenwich was $2^{\circ}51$ ins., or $4^{\circ}47$ ins. below the average, and there was no instance of so small a fall in these three months back to 1815, the nearest approach was $4^{\circ}20$ ins. in 1861. The fall of rain for the 12 months ending September 30th, 1898, is remarkable; it was $14^{\circ}76$ ins., being smaller than in any 12 months ending September 30th back to 1815, the nearest approach was 17 ins. in the twelve months ending September 30th, 1864. The average fall for the same period for 83 years is $24^{\circ}96$ ins. The fall of rain was above its average in each of the months of October, November, and December; the total fall in the three months at Greenwich was

$7^{\circ}78$ ins., being $0^{\circ}70$ in. above the average. The fall of rain at Greenwich for the 12 months ending December 31st, 1898, was small, being $18^{\circ}85$ ins., and there were only seven instances of as small or smaller fall in the same 12 months back to the year 1815, viz.:

1840	it was	Ins. $18^{\circ}30$	1858	it was	Ins. $17^{\circ}80$	1870	it was	Ins. $18^{\circ}56$
1847	"	$17^{\circ}80$	1864	"	$16^{\circ}80$	1884	"	$18^{\circ}05$
1854	"	$18^{\circ}70$						

The average fall for the 83 years is $24^{\circ}92$ ins.

Thunderstorms occurred on 38 days at the different stations; of these 9 were in August, 8 in June, 7 in May, 3 in both April and July, 2 in each of the months of February, March, and October, and 1 in both November and December.

Thunder was heard but lightning was not seen on 46 days; of these 10 were in each of the months of May, June, and August, 5 in July, 4 in April, 3 in October, 2 in September, and 1 in both February and November.

Lightning was seen but thunder was not heard on 29 days; of these 6 were in August, 4 in both May and October, 3 in both September and December, 2 in each of the months of June, July, and November, and 1 in each of the months of February, March, and April.

Solar halos were seen on 86 days; of these 14 were in June, 12 in both April and May, 10 in August, 7 in each of the months of March, July, and October, 5 in February, 4 in January, 3 in both September and November, and 2 in December.

Lunar halos were seen on 61 nights; of these 9 were in both January and November, 8 in both April and December, 6 in February, 5 in both August and October, 4 in both March and May, 2 in June, and 1 in September.

Aurora borealis was seen on 5 nights; of these 2 were in both April and September, and 1 in March.

Snow fell on 47 days; of these 17 were in February, 16 in March, 5 in November, 4 in December, 2 in both April and May, and 1 in June.

Hail fell on 74 days; of these 19 were in February, 13 in March, 9 in May, 8 in February, 7 in both April and November, 5 in December, 3 in October, 2 in August, and 1 in September.

Fog prevailed on 141 days; of these 23 were in November, 21 in October, 20 in January, 14 in March, 12 in December, 11 in April, 9 in September, 8 in both February and May, 7 in August, 5 in June, and 3 in July.

NOTE.—The population in the four years 1862-65 and in the years 1867-69 is estimated by means of the average annual rate of increase observed between the two enumerations of 1861 and 1866. The deaths of Frenchmen abroad, civil or military, are registered in the books of the Commune in which they were last domiciled.

* Census year.

† Cholera prevailed in 1865-66, and war raged in 1870 and 1871.

NOTE.—The numbers for Rome were first included with those for the Kingdom of Italy in 1872. The population figures given for census years show the numbers enumerated on 31st December in each of those years; for the years subsequent to 1881, the population is estimated on the assumption that the rate of increase which prevailed in the last inter-censal period has since been maintained.

* Census year.
